EXECUTIVE SUMMARY

This Completion Report describes field activities and results of final confirmation sampling for a soil excavation program that was conducted at the Building 1065 Corrective Action Plan (CAP) Area, Presidio of San Francisco, California as part of a Phase I Interim Action (IA). The Phase I IA area at The Building 1065 CAP Area is approximately 17,500 square feet and is surrounded by Building 1063 to the north, Building 1062 to the east, Building 1040 to the south, and a parking area to the west. Prior to the Phase I IA, the site was partially paved and contained the concrete foundation of former Building 1065. The Phase I IA Area was the former location of gasoline and diesel underground storage tanks (USTs), an automobile maintenance facility, and below grade fuel oil distribution lines. Soil in the Phase I IA Area is contaminated with petroleum hydrocarbons and metals from past use of these facilities.

The Phase I IA was performed to reduce exposure to construction workers and implement cleanup prior to construction of the Presidio Trust's (Trust's) Water Recycling Project at the Building 1065 CAP Area and to remove contamination in soil as part of the Presidio environmental restoration and cleanup program in accordance with Regional Water Quality Control Board (RWQCB) Order Number R2-2003-0080. At the Building 1065 CAP Area, the Trust plans to reuse and rehabilitate Building 1063 to house a water treatment plant. The Trust also plans to construct a subsurface recycled water storage tank south of Building 1063. Phase I IA excavation work was performed by Performance Excavators and sampling and excavation monitoring was performed by MACTEC Engineering and Consulting, Inc (MACTEC) between November 2003 and March 2004, on behalf of the Trust.

As part of the Phase I IA, vadose zone soil was removed in and around where the recycled water storage tank and utilities will be installed (Phase I Vadose Zone Excavation). Soil was removed to Bay Mud which serves as an aquitard and barrier to the vertical migration of contaminants. The extent of soil removal was limited by the presence of Building 1063 to the north, Building 1062 to the east, and an active sanitary sewer line to south.

As part of the excavation program, Well 1065TMW3A was removed as were the two walls of a former hot well/sump. In addition, during excavation, previously unidentified abandoned underground utility lines, an abandoned sump, a hoist, and a 250-gallon underground storage tank (UST) were encountered and removed. The UST was removed under permits from the San Francisco Fire Department and San Francisco Department of Public Health.

Three areas containing TPHd and TPHfo in soil were identified in vadose zone soil in the planned location of the Thornberg Road Extension, south of the Phase I Vadose Zone Excavation. The Phase I IA included excavating soil from these areas (potholes).

After soil was removed from the Phase I Vadose Zone Excavation and three potholes, confirmation samples were collected from floors and walls of the excavation and from the floors of the potholes. At locations where confirmation sampling from the Phase I Vadose Zone Excavation showed IA target chemicals (TPH, benzene, toluene, ethylbenzene, xylenes [BTEX], or lead) exceeding cleanup levels, soil was further excavated vertically and laterally unless the area was limited by building foundations or active subsurface utilities. Analysis of final confirmation samples showed that TPH, BTEX, and lead concentrations were below cleanup levels in soil in the sidewalls and floor of the excavation.

The completed excavation dimensions were approximately 130 by 95 feet and excavation depths ranged from 9 to 12 feet bgs. Based on topographic surveys completed prior to and following the soil removal, an estimated 3100 cubic yards of soil were removed as part of the Phase I IA. Excavated soil was profiled and transported offsite to Class III (3069.94 tons of soil; based on bills of lading) and Class II landfills (2514.31 tons of soil; based on bills of lading). The excavation was backfilled to grade except within the footprint of the proposed water storage tank. Based on surveys conducted before and after backfilling, an estimated 890 cubic yards of 1½ inch crushed rock and Class II aggregate base were used as backfill.

1.0 INTRODUCTION

This Completion Report describes field activities and results of final confirmation sampling for a soil excavation program that was conducted at the Building 1065 Corrective Action Plan (CAP) Area, Presidio of San Francisco, California as part of a Phase I Interim Action (IA). The Phase I IA was performed to reduce exposure to construction workers and implement cleanup prior to construction of the Presidio Trust's (Trust's) Water Recycling Project at the Building 1065 CAP Area. Soil excavation, backfilling, and soil disposal was performed by Performance Excavators and sampling and excavation monitoring was performed by MACTEC Engineering and Consulting, Inc (MACTEC) on behalf of the Trust. Work was conducted in accordance with the *Final Interim Action Plan, Building 1065 Corrective Action Plan Area, Presidio of San Francisco, San Francisco, California* (*MACTEC, 2003b*) and *Technical Specifications, Interim Action, Building 1065 Corrective Action Plan Area, Presidio of San Francisco, California* (*MACTEC, 2003a*).

1.1 Background

The following sections describe the site, past use, geologic conditions, and identified areas of contamination prior to the Phase I IA. Also provided is a brief description of the Water Recycling Project facilities at the Building 1065 CAP Area as well as the overall purpose and approach for the Phase I IA.

1.1.1 Site Description and Past Site Use

The Phase I IA area is approximately 17,500 square feet and is surrounded by Building 1063 to the north, Building 1062 to the east, Building 1040 to the south, and a parking area to the west. Prior to the Phase I IA, the site was partially paved and contained the concrete foundation of former Building 1065. An approximate 4-foot high corrugated iron and concrete retaining wall formed the northern edge of the Building 1065 foundation. The Phase I IA area was also separated from the parking lot to the west by a concrete retaining wall. Prior to the Phase I IA, site elevation in the southern part of the Phase I IA area

was 17 feet relative to National Geodetic Vertical Datum of 1929 (NGVD29). North of the Building 1065 retaining wall, ground surface elevation was approximately 13 feet NGVD29.

Buildings 1063, 1062, and 1040 are currently unoccupied. Building 1063 was a warehouse, Building 1062 formerly served as an occupational therapy facility, and Building 1040 formerly served as a power house/steam plant. The steam plant used fuel oil that was stored in above ground storage tanks (ASTs) west of Building 1040. The ASTs were filled via a fuel distribution pipeline that ran along the west and south sides of the buildings. The ASTs and fuel distribution lines were removed in 1996.

Former Building 1065 was used for painting, automobile maintenance, and contained two incinerators that were used to destroy pathological wastes. The incinerators were removed in the mid-1990s and Building 1065 was demolished in 1996. South of former Building 1065 was the Post Exchange Service Station (Old Building 1064) that contained three underground storage tanks (USTs) that stored diesel and gasoline. These USTs were removed from the Phase I IA area in 1996. There was a former sump located just west of Building 1062 that was identified as a hot well on several maps for the site; its use is unknown. Two walls and the floor of the sump were removed in 2002 and the excavation was backfilled with crushed concrete from the Letterman Hospital demolition project.

1.1.2 Geologic Conditions

Lithologic logging of borings drilled in the area shows that soil in the Phase I IA area consists of fill and native sand to a depth of approximately 7.5 feet, where it is underlain by Bay Mud. Fill is a heterogeneous mixture of various soil types including clay, silt, sand, and gravel and generally contains anthropogenic debris including brick, asphalt, concrete, wood, metal, wire, and porcelain. Native sand consists of clayey or silty sand and silt. The Bay Mud consists of soft silt and fat clay with peat and fine sand lenses. Groundwater was encountered during drilling in the Phase I IA area at depths between 4 and 7 feet below ground surface (bgs).

1.1.3 The Water Recycling Project

As part of the Water Recycling Project, the Trust plans to reuse and rehabilitate Building 1063 to house the water treatment plant. The Trust also plans to construct a subsurface recycled water storage tank south of Building 1063. The storage tank will be approximately 45- by 100-feet and 28 feet deep. Underground utilities and piping will be installed between the water tank and Buildings 1063 and 1040.

1.1.4 Identified Areas of Contamination

Previous soil and groundwater sampling at the Phase I IA area indicates that soil within and around the footprint of the recycled water storage tank contains total petroleum hydrocarbons as (TPH) gasoline (g), diesel (d), fuel oil (fo), benzene, ethylbenzene, methylene chloride, lead, arsenic, and cadmium above Presidio cleanup levels (*EKI, 2002*). Shallow groundwater contains benzene above cleanup levels. Free phase petroleum product has been measured in a 10-foot deep well 1065TMW3A, located within the footprint of the Phase I Vadose Zone IA excavation.

1.1.5 Purpose and Approach

The purpose of the Phase I IA was to remove contamination within and around the footprint of the recycled water storage tank and piping so that future construction activities can be safely conducted without increased risk to workers and other receptors from site contaminants. The Phase I IA also served to remove contamination in soil as part of the Presidio environmental restoration and cleanup program in accordance with RWQCB Order Number R2-2003-0080.

As part of the Phase I IA, vadose zone soil was removed in and around where the recycled water storage tank and utilities will be installed (Phase I Vadose Zone Excavation). Soil was planned to be removed to Bay Mud which serves as an aquitard and barrier to the vertical migration of contaminants. As part of the excavation program, Well 1065TMW3A was removed as were the two walls of the former hot well/sump. The extent of soil removal was limited by the presence of Building 1063 to the north, Building 1062 to the east, and an active sanitary sewer line to the south.

Three areas containing TPHd and TPHfo in soil were identified in vadose zone soil in the planned location of the Thornberg Road Extension, south of the Phase I Vadose Zone Excavation. These isolated areas were near or adjacent to active subsurface utility lines. The Phase I IA included excavating soil from these areas (potholes), because after Thornberg Road is graded and paved, soil removal from this area would become problematic.

After soil was removed from the Phase I Vadose Zone Excavation and three potholes, confirmation samples were collected from floors and walls of the excavation and from the floors of the potholes. If confirmation sampling from the Phase I Vadose Zone Excavation showed target chemicals (TPH, BTEX, or lead) exceeding cleanup levels, soil was further excavated laterally unless the area was limited by building foundations or active subsurface utilities. The excavation was not planned to extend vertically more than 2 feet into the Bay Mud to avoid compromising the integrity of the aquitard.

2.0 PHASE I INTERIM ACTION FIELD ACTIVITIES

Field work for the Phase I IA was performed between November 10, 2003 and March 3, 2004, by Performance Excavators, San Rafael, California under Contract to the Presidio Trust. Field activities were supervised and documented and confirmation soil and wastewater samples were collected by a MACTEC geologist. The following describes activities performed in support of the Phase I IA. Activities are described in the general order that they were performed. Table 8 provides a daily log of field activities. Appendix A contains photographs taken during the Phase I IA field work.

2.1 Mobilization

Mobilization for excavation activities began on November 10, 2003. Mobilization activities included:

- Erecting temporary chain link fencing
- Towing vehicles parked in the portion of the parking lot designated as the stockpile staging area. This activity was performed by the Presidio Police Department.
- Delivery of a lockable Conex box for equipment storage
- Delivery of sandbags and polyethylene sheeting for the stockpile staging area
- Delivery of heavy equipment including a Linkbelt 2700 excavator, a CAT IT286 front end loader/forklift, and a CAT 325C excavator with hydraulic breaker.

2.2 Pre-Excavation Survey

A survey crew from R. W. Davis Surveyors surveyed the pre-excavation surface on November 10 and 12, 2003. Monitoring Wells 1065MW009B and 1065MW010B were used as control points for the topographic survey. Horizontal coordinates were surveyed relative to the 1927 North American Datum, Zone 3 (NAD 27) and elevations were measured relative to NGVD29. Appendix B contains as Exhibit 1 a plate showing pre-excavation topography.

2.3 Utility Location

Prior to start of work, previous geophysical surveys and utility location records were reviewed. A composite utility map was generated to aid field identification of active and inactive lines. Active subsurface utilities were identified and marked in the field by personnel from the Trust's utility department. On November 10, 2003, a Trust electrician turned off power to Building 1063 and the former Building 1064 pump island area and a Trust plumber turned off water lines in the retaining wall at the north end of the former Building 1065 foundation. PG&E crews (USA ticket Number 356325), identified a natural gas "T" as being inactive and gave Performance Excavators clearance to dig at that location. On Thursday, November 13, 2003, a Trust electrician cut the power lines at Buildings 1040 and 1063, so that when the lines were removed by Performance Excavators, the wires would not be pulled out from their fuse boxes.

2.4 Demolition and Disposal of Concrete and Asphalt

Between November 10 and 12, 2003, concrete and asphalt within the Phase I IA excavation area boundaries were broken up and removed using a CAT 325 excavator with hydraulic breaker attachment and Linkbelt excavator. Soil was separated from concrete and asphalt debris, which was staged in separate stockpiles from the soil. Concrete removed included the retaining wall at the north end of the former Building 1065 foundation; this wall had been identified as a possible historic structure. Performance Excavators received authorization from the Trust on November 11, 2003, to demolish the retaining wall and dispose of the materials with the concrete and asphalt. Asphalt and concrete debris were disposed at Syar in Richmond, California.

2.5 Stockpile Staging Areas

On November 12, 14, and 20, 2003, three stockpile staging areas set up in the paved parking lot west of the Phase I IA Area. Storm drains in the footprint of the stockpile staging areas were sealed prior to construction. The staging areas were constructed using reinforced plastic sheeting joined using heavy duty tape. The edge of each stockpile area was bermed by placing approximately 1-foot-high rows of soil

on top of the plastic sheeting, and then folding the sheeting over the soil and securing it with sandbags. Soil was transferred from the excavation area to the stockpile areas using ten-wheel dump trucks. At the end of each day, soil stockpiles were covered with plastic sheeting. The sheeting was secured using sandbags or rope. In response to complaints about soil odor from the Webcor offices directly down wind of the site, soil stockpiles were covered during excavation activities, as was feasible.

2.6 Soil Excavation Activities

Excavation of soil began on November 13, 2003, beginning approximately 4 feet from and parallel to the west wall of Building 1062. Soil was excavated within the boundaries of the proposed Phase I IA excavation as shown on Plate 3. Soil was initially removed to the grade of Building 1063 (approximate depth of 4 feet bgs), then extended to planned excavation depths (5.5 to 9.5 feet bgs), except where visual observations, PID readings, or confirmation soil sampling results indicated contaminated soil was present.

As excavation proceeded to the west, excavation was temporarily stopped as previously unidentified underground utility lines, a sump, a hoist, a 250-gallon UST, and contaminated utility line backfill were encountered. The Trust was called in to identify whether the utility lines were inactive and give Performance Excavators direction regarding removal and future replacement of active utility lines. Excavation activities temporarily stopped on November 12, 13, 14 (for rain), 17, 18, and 20, 2003.

Excavation activities also included removal of Monitoring Well 1065TMW3A, which was located within the excavation footprint. This well was removed on November 25, 2003 by digging out the well with the excavator. This resulted in removal of soil to a depth of 13.5 feet bgs. Confirmation sample 1065EX228(13.5) was collected from the location of the former well.

Planned excavation activities also include removal of two concrete sump walls, concrete forms, crushed concrete backfill, and visibly contaminated soil associated with a former sump located adjacent to Building 1062. Because the former sump walls and contaminated soil extended 10 feet below grade close to Building 1062, crushed concrete from the former sump excavation was placed back in the excavation

to prevent failure of the excavation walls adjacent to Building 1062. The crushed concrete was placed against the excavation walls up to the elevation where the building foundation was exposed. The material was not compacted. A sample of the material (1065EX219[7.5]) was collected and analyzed for target chemicals to evaluate whether there were contaminants present in the replaced backfill. Chemical analysis showed that this backfill contained cadmium and TPHfo above cleanup levels (Table 4). As discussed below, this soil was later removed as part of over-excavation activities.

Over-excavation activities included removal of soil showing staining or exhibiting petroleum odors and removal of soil in areas where IA target chemicals exceeded cleanup levels as described below.

- **Stained Soil and Petroleum Odors** - Soil was removed from the excavation floor downgradient of 1065TMW3A on November 21, 2003, because soil at the planned final grade elevation was stained and exhibited petroleum odors; this material was removed until PID readings showed no elevated volatile organic compounds.

- **Exceedances of IA Target Chemical Cleanup Levels** - Additional over-excavation was performed in two locations in the excavation floor and two sidewall locations because initial confirmation samples showed TPHg, TPHd, TPHfo, and/or benzene above cleanup levels. These areas are described below:

Over-excavation from Floor

- 450 square foot area at 1065EX227(6.5) and 1065EX230(6.5) on January 23, 2004

- 150 square foot area at 1065EX219(7.5) (crushed concrete from the sump excavation) on January 30, 2004.

Over-excavation from Sidewalls

- 25 feet of sidewall at 1065EX203(6.5) on December 8, 2004

- 20 feet of sidewall at 1065EX238(6.5) on January 30, 2004.

Analytical results for soil samples removed by over-excavation are provided in Table 4. Where soil was over-excavated at 1065EX219 and 1065EX238, confirmation samples were immediately collected and the area backfilled because the over-excavation was in close proximity to the foundation of Building 1062.

Excavation was completed on January 30, 2004, when final confirmation soil samples were collected. The limits of the excavation, as specified in the work plan, and construction plans and specifications, were generally observed. The excavation dimensions were approximately 95 by 130 feet and excavation depths ranged from 9 to 12 feet bgs (Plate 3).

2.7 Removal of Underground Utilities

As discussed in Section 2.6, underground utilities were encountered during excavation activities. The Trust was notified if unmarked utilities were encountered and work stopped until the Trust authorized removal of the lines. Only the portion of the lines located within the excavation footprint were removed. Except for the steam lines, the removed lines were plugged with grout where they exited the excavation. Active lines were replaced during backfilling. Steam lines were cut, but not plugged. The Trust plans to cap or plug steam lines during the Phase II IA. The utilities encountered included electrical lines, abandoned steam lines, clay storm drains and sanitary sewer lines, and concrete utility trenches (Plate 2).

Abandoned Steam Lines

The abandoned steam lines consisted of asbestos- or fiberglass-wrapped or lined iron piping. Some suspected steam lines also appeared devoid of wrapping or lining. The asbestos-wrapped lines were identified, cut, carefully removed, the exposed ends taped (asbestos-lined pipe) or wrapped in plastic sheeting (asbestos-wrapped pipe), and set aside for disposal by the Trust Asbestos Abatement Department. Small, loose asbestos fragments were bagged separately. Abandoned steam lines were found at the following locations:

- In the retaining wall

- At the northeast corner of the excavation. One of the lines found on the northeast edge of the excavation contained opaque, black, viscous fluid with a hydrocarbon odor. This line was removed and the surrounding soil excavated.

- Along the eastern edge of the excavation.

- Adjacent to an active storm sewer adjacent to Building 1062

Storm Drains and Sanitary Sewer Lines

Storm drains and sanitary sewer lines were found at the following locations:

- A section of an active clay storm drain was encountered and removed along the northern edge of the excavation parallel to Building 1063. The drain was about one foot below ground surface and drained to the east. The Trust authorized Performance Excavators to remove the line, and plug the ends with grout where they exited the excavation. The line was replaced with a PVC line during excavation backfilling activities.

- Two risers coming off the protected sewer line on the east side of the excavation adjacent to Building 1062 were cut and capped.

- A section of a second clay sewer line was removed from the northern edge of the excavation. Although located outside the planned excavation limits, the line was removed because stained soil was observed inside the pipeline and in the surrounding soil and backfill.

- A section of a 10-inch diameter clay pipe was exposed in the vicinity of Monitoring Wells 1065MW9A and 9B. The line was filled with black decomposed sewer material and a small amount of soil; it was presumed to be inactive. After receiving authorization from the Trust, the line was cut, removed, and the ends plugged where they exited the excavation.

Concrete Utility Trench

A concrete utility trench was encountered in the southeast corner of the excavation, parallel to the edge of Building 1062; soil around it had fuel odor and staining. This utility trench was removed although it was located outside the planned excavation limits.

2.8 Removal of Buried Concrete Foundation, Sump, and Hoist

During excavation activities, various buried items were encountered and removed after receiving authorization from the Trust. On November 12, 2003, a concrete sump was exposed while excavating soil and concrete beneath the foundation of former Building 1065 (Plate 2). The sump measured approximately 4- by 16-feet by 3 feet deep and was filled with ¾ inch drain rock. There were two 3- to 4-inch diameter cast iron pipes connected to the south and west sides of the sump and one 2-inch pipe connected to the north end of the sump. The base of the sump was sloped; dark black viscous fluid was observed at the northern, down-slope end of the sump. The sump was surveyed by R. W. Davis Surveyors before it was removed (November 16, 2003). Performance Excavators received approval to remove the sump on November 17, 2003. Soil and rock within and surrounding the sump were initially staged separately from other soil, but were later mixed with and profiled with other soil from the excavation.

On, November 13, 2003, an approximately 15-foot long concrete retaining wall-like structure, a crushed, rusted 55-gallon drum, and a rusted hydraulic hoist were removed from the excavation at the western end of the footprint of former Building 1065 (Plate 2). The hoist contained residual oil, and soil was discolored in the vicinity of both the drum and hoist. The drum and hoist were staged separately on plastic sheeting, and absorbent material was used to contain leaking hydraulic oil from the hoist.

2.9 Removal of Tank 1065.4

On November 19, 2003, a UST (Tank 1065.4) was encountered just south of the location of three former diesel and gasoline USTs that were removed in 1996. Soil was removed from around the UST. The tank

was cylindrical, constructed of riveted steel, and was 3.2 feet in diameter and 4.0 feet long; no leaks or holes were observed in the UST. Estimated capacity of the UST was 250 gallons. The vent riser and piping had been broken off by the excavator bucket. A PID reading taken at the point where the vent riser was previously attached was 55 parts per million (ppm). Fluid was visible through the openings at the top of the tank, and a stainless steel bailer was lowered into the tank to visually observe the fluid contained in the UST. The fluid in the bailer consisted of water with a strong fuel odor and sheen. There appeared to be a small amount of sediment at the bottom of the tank.

The Trust submitted a Work Plan (*MACTEC, 2003c*) and Underground Storage Tank Application to the San Francisco Department of Public Health (SFDPH) and the City of San Francisco Fire Department (SFFD) on November 20, 2003. On November 20, 2003, water was pumped out of the UST into two 55-gallon drums, which were staged onsite. The drums were later moved to the Central Magazine Area and were sampled on February 24, 2004, to characterize the water for disposal. Results are presented in Table C2 of Appendix C. The water was disposed by Clearwater Environmental on June 17, 2004.

On November 24, 2003, the UST was removed under the supervision of the SFDPH and SFFD. The PID reading within the empty tank was 25 ppm, and the PID reading in the surrounding soil was 40 ppm. Soil was further removed from around the UST and the UST was filled with dry ice to purge any vapors remaining in the tank. The lower explosive limit (LEL) measurement in the UST was 4% and oxygen was 5.5%. After receiving authorization from the SFFD, the UST was removed from the excavation, loaded onto a truck along with the previously removed hydraulic hoist, transported by Ecology Control Industries (ECI) (a licensed hauler) and disposed at an ECI facility in Richmond, California. ECI's Richmond Facility is permitted to provide UST decontamination and reclamation. Further information concerning removal of the UST can be found in the Tank 1065.4 Removal Report (Appendix C).

2.10 Air Monitoring

Air monitoring was conducted during excavation activities. Air monitoring consisted of collecting measurements of organic vapors in and around the excavation when soil removal was being conducted. Perimeter air monitoring consisted of collecting volatile organic vapor measurements outside of the fence line that marked the Phase I IA work area.

2.10.1 Excavation Air Monitoring

During excavation activities, air monitoring was performed using a PID when discolored soil was encountered. Monitoring was conducted within the breathing space of personnel on the ground and within the elevated cabs of the equipment. If PID readings were above action levels (1 ppm), the crew was notified to don respirators. During excavation and removal of petroleum-contaminated soil from the area immediately around the former USTs, onsite personnel wore respirators full time in the exclusion zone.

2.10.2 Perimeter Air Monitoring

During excavation activities, perimeter air monitoring was conducted to ensure that exposure limits were not exceeded outside the perimeter of the work area. Perimeter monitoring consisted of taking PID measurements along the entire perimeter fence line (exclusion zone), along the western fence line adjacent to the stockpile staging area, along Gorgas Avenue, and along Kendall Road near the eastern ends of Buildings 1063 and 1062. Perimeter air monitoring was performed on November 19, 20, 21, and 25, 2003. The following summarizes perimeter air monitoring results:

- November 19 – PID readings ranged from 0.2 to 0.7 ppm along the perimeter fence line and strong petroleum odors were periodically noted during soil excavation and stockpiling activities.

- November 20 - During the morning hours, PID readings were all 0 ppm. In the early afternoon, PID readings were 0 ppm along the western fence line adjacent to the stockpile staging areas; up to 0.5 ppm along Gorgas Avenue; and up to 0.1 ppm along Kendall Avenue.

- November 21 - During the morning hours, PID readings were 0 ppm along the western fence line; up to 0.5 ppm along Gorgas Avenue; and up to 0.5 ppm along Kendall Avenue. In the early afternoon, PID readings were 0 ppm along the western fence line; 0 ppm along Gorgas Avenue; and up to 0.5 ppm along Kendall Avenue.

- November 25 - Perimeter air monitoring showed PID readings of 0 ppm.

2.11 Excavation Dewatering and Wastewater Disposal

Rainwater and related surface water runoff entered the excavation during the soil excavation program. Water was removed from the excavation prior to collecting confirmation samples from the excavation floor and prior to backfilling the excavation. Water was pumped from the excavation using an electric submersible pump powered by a portable generator. Water was stored into high-volume baffled storage tanks, designed to optimize sediment retention prior to discharge. A water sample (1065WW200) was collected from the tank on December 8, 2003 by MACTEC to assess whether the water in the excavation met San Francisco Public Utilities Commission (SFPUC) acceptance criteria for batch wastewater discharges. The sample was collected by lowering a new polyethylene bailer into the water tank through the top hatch of the storage tank. No product was observed in the sample. Samples were analyzed for the following analytes:

- TPHg

- pH (pH units)

- Dissolved Sulfides

- Hydrocarbon Oil and Grease

- Total Recoverable Oil and Grease

- Total Suspended Solids

- Chemical Oxygen Demand
- Phenols
- Cyanide (Total)
- Flashpoint
- Metals
- Aromatic and Halogenated Organic Compounds

The following field parameters were collected from each of the water storage tanks.

Location	T_2 (North)	T1 (South)	Units	Discharge Limits
pH	7.22	6.74	-	6.0 minimum, 9.5 maximum
Temperature	51.8	54.9	F	125 º F
Conductance	2.02 x 100	2.19 x 100	µS/cm	NA
Turbidity	152	>1000	NTU	NA

Analytical results are presented in Table 2. Review of analytical results showed that contaminants met SFPUC acceptance criteria and on December 12, 2003, the Trust authorized Performance Excavators to discharge the excavation water into the Trust's sanitary sewer. Approximately 40,000 gallons of water were discharged into a sanitary sewer manhole located west of the Phase I IA area during three separate events between December 17, 2003 and January 27, 2004.

2.12 Potholing

In accordance with the work plan, soil was excavated from three localized areas (potholes; Plate 3) where TPH was previously detected in soil samples from borings and excavation samples above cleanup levels. On December 18, 2003, soil was excavated in the vicinity of former sample 1065SB102 using a backhoe. The pothole was 7 by 5 feet and 8.5 feet deep. A second pothole, measuring 3 by 6 feet by 3 feet deep,

was excavated at the former location of sample FDS1040L03, just south of an active sewer line. The third pothole was dug at the location of sample 1040EX11 between two marked utilities. The pothole measured 2 by 8 feet and was 5 feet deep. A black plastic sewer line was uncovered on the south edge of the pothole at 4 feet bgs and steam lines were encountered at the east end of the pothole at 3 feet bgs. No elevated PID readings or visible evidence of contamination were observed in soil removed from the three potholes.

2.13 Confirmation Sampling

Confirmation soil samples were collected from the sidewalls and floor of the Phase I Vadose Zone Excavation to characterize residual contaminants left in place and verify that cleanup levels had been achieved. Confirmation samples were collected for every 25 lineal feet of sidewall and from the excavation floor based on a 25- by 25-foot grid. Excavation soil samples are shown on Plate 3 and Table 1 lists confirmation soil samples. Prior to sampling, soil disturbed by excavation equipment was scraped off to expose undisturbed soil.

Confirmation soil samples were collected by advancing a clean 6-inch long stainless steel tube directly into the soil in the excavation sidewall or floor. In some cases, the soil was soft enough to push the tube directly into the soil by hand, and where the soil was firmer, a clean stainless steel plate was held against the end of the tube and it was hammered into the soil. The ends of the tubes were capped with Teflon squares and plastic caps, the tubes were labeled, and then stored in an ice chest with ice. Soil samples were transported to Sequoia Analytical Laboratory and analyzed for TPHg, TPHd, TPHfo, metals, and VOCs. In addition, selected samples were analyzed for total organic carbon (TOC). TOC results will be used to evaluate soil properties that may affect various remedial options.

Results for TPH, benzene, toluene, ethylbenzene, xylenes (BTEX), and lead were compared to Phase I IA cleanup levels (Table 3). If the sample results exceeded the cleanup levels, additional soil was removed and the excavation was re-sampled using protocols described above. Samples with IA target compounds

(TPH, BTEX, and lead) that exceeded cleanup levels, are shown in grey on Plate 3. These samples and surrounding soil were removed by over-excavation (Section 2.6) and additional confirmation soil samples were collected.

Where contaminated soil was observed adjacent to or in close proximity to a building foundation or subsurface utility line, it was not possible to remove all visibly contaminated soil without compromising the structural integrity of the building foundation or utility line. In these cases, as much contaminated soil was removed as was feasible, and a confirmation sample was collected.

One confirmation soil sample was collected from the floor of each of the three potholes excavated south of the Phase I Vadose Zone Excavation. Samples were retrieved from the floor of the pothole using protocols described above, except for one pothole (by 1065SB102) where the sample was retrieved with the bucket of the backhoe. The sample was collected by scraping soil from the surface of the backhoe, and inserting the sample tube into soil within the backhoe bucket until the tube was completely full. The sample was capped and handled as previously described.

2.14 QC Samples

Six duplicate soil samples were collected as part of excavation sampling. In addition, two equipment blank samples were collected and two trip blanks were submitted for analysis. Trip blanks were collected when water samples were submitted for analysis. Equipment blanks were submitted if reusable sampling equipment was utilized for collection of samples (water samples). Because soil samples were collected by directly pushing the sample tube into the excavation sidewall or floor, no equipment blanks were necessary for soil sample collection. QC samples are summarized in Table 2.

2.15 Final Excavation Survey

The completed excavation was surveyed by R.W. Davis on January 27, 2004. Appendix B provides as-builts for the completed excavation (Exhibit 2; As-Built 1st Excavation).

2.16 Excavation Backfilling

The Trust originally planned to use soil stockpiled from the Letterman Digital Arts excavation as backfill for the Vadose Zone Excavation. A sample collected on November 18, 2003 and submitted to RGH Geotechnical and Environmental Consultants (RGH) for compaction tests (ASTM D1557) showed that it was suitable for backfill material with a maximum dry density of 127 pounds per cubic foot (pcf) and optimum moisture of 11 percent. Compaction test results are presented in Appendix D. However, when the excavation was ready to be backfilled, the stockpiled soil had not been adequately protected from rain and had a moisture content of 15.8 percent.

Performance Excavators identified another backfill source (Potrero Hills) and samples were submitted to Sequoia Analytical (1065SP200) for analysis for TPHg, BTEX, Title 22 metals, and PCBs and organochlorine pesticides and to RGH for compaction tests on December 29, 2003. The material was a brown clayey sand with a maximum dry density of 124 pcf and optimum moisture content of 11 percent (Appendix D). Although this material met requirements, Performance Excavators expressed concern over the potential for high moisture in the imported backfill from continued rain and after discussion with the Trust, agreed that Class II AB from Lake Hermann Quarry would be used as backfill. A sample was collected by MACTEC on January 26, 2004 (1065SP201) and submitted to Sequoia for analysis for TPHg, TPHd, TPHfo, and Title 22 metals and to RGH for compaction testing. Compaction tests showed the material (gravel with silt and sand) had maximum dry density of 138 pcf and optimum moisture content of 9 percent. Compaction test results are in Appendix D. Analytical results showed that TPH and metals were below cleanup levels (Table 5) and accordingly, the material was approved to be used as backfill.

On January 26, 2003, the Trust approved a change in specifications for backfilling the Phase I Vadose Zone Excavation. Gravel was to be placed in a 6- to 12-inch-lift on the part of the excavation floor that coincided with the footprint of Birmingham Road (northern part of excavation). The gravel was then covered with geotextile fabric, and covered with compacted Class II aggregate baserock. The portion of

excavation that lay within the Birmingham Road footprint would be backfilled to near final grade elevation. Sidewall slopes were to maintain the originally designed slopes of 4:1 and 8:1. Slopes would continue to the floor of the existing excavation. No imported material would be placed within the footprint of the planned subsurface water storage tank (the southern part of the excavation) because that material would be excavated during construction of the water storage tank.

On January 29, 2003, Performance Excavators placed 12 inches of 1½ inch crushed rock and geotextile fabric along the north edge of the site. Class II aggregate baserock was then placed and compacted. End-dump trucks dumped the aggregate, which was spread with a bulldozer, and then compacted with a vibratory roller. The active sanitary sewer along the east end of the site was covered with aggregate base rock and compacted. Two field density tests were performed by MACTEC on January 29, 2003 and showed compaction of 97% maximum density.

On January 30, 2003, Performance Excavators continued to place and compact imported aggregate base in thin lifts. Three field density tests performed by MACTEC showed respective compactions of 95%, 98%, and 100% of maximum density.

On February 2, 2003 a geotechnical site inspection found that Performance Excavators had completed work. The backfilled surface was firm and smooth. All surfaces were sloped to meet design specifications and drained into the future water storage tank footprint.

2.17 Final Post-Grading Survey

The backfilled excavation was surveyed by R.W. Davis on March 3, 2004. Appendix B shows plans for the As-Built Gravel Fill (Exhibit 3; Appendix B) and Cross section of the Gravel Fill (Exhibit 4; Appendix B).

2.18 Soil Profiling and Disposal

Soil stockpile samples were collected by Performance Excavators for waste profiling. One 4-point composite sample was collected for each 550 cubic yards of stockpiled soil. Samples were collected by driving 6-inch stainless steel liners into newly exposed soil. Samples were analyzed by Severn Trent Laboratories of Pleasanton, California for TPHg, d, motor oil (mo), BTEX, VOCs, semivolatile organic compounds (SVOCs), polychlorinated biphenyls (PCBs), metals, and hexavalent chromium. Selected samples were also analyzed for vanadium, chromium, lead and mercury by the California Waste Extraction Test (CA W.E.T).

After profiles were approved and signed by the Trust and the disposal facility reviewed the profiles and analytical results, stockpiled soil was loaded into dump trucks operated by Cross Trucking, Forestville, California, a licensed, DOT-approved hazardous waste transportation contractor. Bills of lading indicate that 2514.31 tons of soil was transported to Hay Road Landfill, Vacaville, California (Class II Facility) and 3069.94 tons of soil was transported to Ox Mountain Landfill, Half Moon Bay, California (Class III Facility). Table 6 provides a list of soil loads and weights disposed at the two facilities. Appendix F presents waste profiles and bills of lading.

2.19 Demobilization

In February 2003, the equipment and materials stored at the site were demobilized. Dewatering equipment, which consisted of two 10,000 gallon baffled tanks, submersible pump, and associated hosing, was removed by Rain-for-Rent between February 2 and 4, 2003. On February 4, 2003, the CAT IT286 loader and CAT 416 backhoe were picked up and transported offsite. The Linkbelt 2700 excavator picked up and removed from the site on February 17, 2003. The John Deere 644 Loader was taken off site on February 23, 2004.

3.0 LABORATORY ANALYSIS AND DATA VALIDATION

The following provides a summary of the Phase I IA analytical program.

3.1 Excavation Confirmation Soil Samples

Excavation confirmation soil samples were submitted under chain of custody to Sequoia Analytical Laboratories for the following analytes and test methods.

- TPHd (petroleum hydrocarbons in the C12-C24 range) – USEPA Test Method 8015B with silica gel cleanup (SW3630A)
- TPHfo (petroleum hydrocarbons in the C24-C36 range) – USEPA Test Method 8015B with silica gel cleanup (SW3630A)
- TPHg (petroleum hydrocarbons in the C7-C12 range) – USEPA Test Method 8015B
- VOCs – USEPA Test Method 8260B
- Title 22 Metals – USEPA Test Method 6010/6020-7000 Series
- TOC – Walkley Black (only selected soil samples were analyzed for TOC).

3.2 Wastewater Samples

Wastewater samples were collected by MACTEC and analyzed by Sequoia Analytical Laboratories for the following parameters:

- pH - USEPA Test Method 150.1
- Dissolved Sulfides - USEPA Test Method 376.2
- Hydrocarbon Oil and Grease - USEPA Test Method 418.1

- Total Recoverable Oil and Grease - USEPA Test Method 413.1
- Total Suspended Solids - USEPA Test Method 160.2
- Chemical Oxygen Demand - USEPA Test Method 410.4
- Phenols - USEPA Test Method 420.1
- Cyanide (Total) - USEPA Test Method 335.2
- Flashpoint - USEPA Test Method 1010
- Arsenic, cadmium, chromium, copper, lead, nickel, silver, and zinc (Total) - USEPA Test Method 6010B
- Mercury (Total) - USEPA Test Method 7470A
- Aromatic and Halogenated Organics - USEPA Test Method 8260B

3.3 Backfill Samples

The backfill sample from Potrero Hills was collected by the Trust and analyzed by Sequoia Analytical Laboratories for:

- TPHg - USEPA Test Method 8015B
- TPHd, fo - USEPA Test Method 8015B with silica gel cleanup (SW3630A)
- Organochlorine pesticides and PCBs - USEPA Test Method 8082

The backfill sample from the Lake Hermann Quarry was collected by MACTEC analyzed by Sequoia Analytical Laboratories for:

- TPHg - USEPA Test Method 8015B

- TPHd, TPHfo - USEPA Test Method 8015B with silica gel cleanup (SW3630A)

- Title 22 Metals – USEPA Test Method 6010/6020-7000 Series

Appendix G contains laboratory analytical reports and Table 2 lists test methods and turnaround times for these samples.

3.4 Stockpile Samples

Stockpile soil samples were collected by Performance Excavators and submitted to Severn Trent Laboratory. Samples were analyzed for

- TPHg/BTEX - USEPA Test Methods 8015M/8021

- TPH d, TPHmo - USEPA Test Method 8015M

- VOCs - USEPA Test Method 8260B

- SVOCs - USEPA Test Method 8270C

- PCBs - USEPA Test Method 8082

- CAM 17 Metals - USEPA Test Methods 6010B, 6020, and 7471A

- Hexavalent Chromium - USEPA Test Method 7196A

- Selected samples were also analyzed for vanadium, chromium, lead and mercury by the California Waste Extraction Test (CA W.E.T) 3005A/6010B and 7470A.

Appendix E contains analytical results for these samples.

3.5 Data Validation

Soil excavation sample results were subjected to data validation in accordance with the Presidio-Wide Quality Assurance Project Plan (QAPP; *Tetra Tech 2001*). Wastewater and stockpile sample analytical

results were not validated because they were sampled to meet landfill and SFPUD specifications. Data validation results are summarized in Appendix H.

Review of the data validation results indicates the following significant findings:

- Reporting limits for the soil samples were raised due to dry weight correction. Many of the soil samples were collected from the floor of the excavation after the excavation had been dewatered and were very moist to saturated.

- Results for acetone and vinyl acetate in the rinsate and trip blanks were nondetect and qualified as rejected (R) due to minimum average relative response factor failure. Acetone and vinyl acetate are not target analytes for the Phase I IA.

- The nondetect results for TPHg and unknown purgeable hydrocarbons in Sample 1065EX234(9.5) were qualified as rejected (R) due to extremely low surrogate recovery. This sample is located in the footprint of the water recycled storage tank and soil in this area will be removed as part of construction of the below grade water storage tank.

- The nondetect result for TPHg and unknown purgeable hydrocarbons in DUP(040123) was qualified as rejected (R) due to extremely low surrogate recovery. It should be noted that the result for TPHg in this sample was changed to nondetect due to method blank contamination. TPHg result for the associated primary sample was not rejected with a reported value of 0.08 mg/kg.

- Only one of the six field duplicate pairs met the relative percent difference precision control requirement of 50 percent. This was not entirely unexpected, because soil samples have inherent inhomogeneity.

Comparison of detection limits for nondetect compounds to cleanup levels for confirmation soil samples shows that reporting limits (RLs) for several VOCs and arsenic were above cleanup levels. A summary

of this comparison is presented as Table H4 in Appendix H. However, except for two samples with high concentrations of TPHg (1065EX208 [8.0] and DUP120803), method detection limits (MDLs) for these compounds were below cleanup levels. Because detections between the RL and MDL were reported as estimated values (J-flagged), any detection above the cleanup level would have been reported for these analytes.

4.0 FIELD OBSERVATIONS

4.1 Soil and Groundwater Conditions

Logs of excavation sidewalls are presented on Plate 4. In the southern end of the excavation, the first 2 to 3 feet of material encountered consisted of silty sand and gravel with construction/municipal debris, including, but not limited to, brick, rock, cobblestones, wood fragments, metal, ceramic tiles, porcelain, bottles, and jars. Shallow soil encountered in the northern portion of the excavation consisted of red chert fill material with no debris or refuse. Brown to yellow brown silty sand with localized zones or lenses of gravel was encountered between 3 and 6 feet bgs. The brown to yellow brown silty sand was underlain by a heterogeneous greenish grey to very dark grey silty to clayey sand. This material was encountered between 6 and 8 feet bgs, and displayed an odor of organic decay and sulfur. Bay Mud, consisting of olive grey to black clay and sandy clay, was encountered below this unit. At depths of 12 feet bgs (the maximum excavation depth), the Bay Mud contained organic material and sand lamina.

4.2 Areas of Contamination

As shown on Plate 2, areas of soil staining and elevated PID readings were observed in the vicinity of the former USTs and in an area of soil that extended north and downgradient of the former USTs. Soil beneath the western portion of the former Building 1065 foundation and soil north and downgradient of former Building 1065 also exhibited elevated PID readings and staining. In addition, contaminated soil and contaminated backfill was found inside of and surrounding underground utility lines encountered during excavation. The lines and backfill appeared to have served as preferential pathways for the migration of petroleum hydrocarbons as described below.

- Opaque black viscous fluid was found in an abandoned steam line in the northeast end of the excavation

- Contaminated soil was found inside of a clay sewer line at the northern edge of the excavation. Backfill surrounding the line showed staining and exhibited odors

- Soil around a concrete utility trench the southeast corner of the excavation was stained and exhibited fuel odors

- Stained sand backfill was observed around abandoned sewer lines adjacent to the existing sanitary sewer manhole in the northeast corner of the excavation.

5.0 FINAL SITE CONDITIONS

5.1 Results of Final Confirmation Sampling

Final confirmation sample locations are shown on Plate 3 and Table 7 presents a summary of detected compounds in final confirmation soil samples. Review of these data shows that concentrations of detected compounds were below Phase I IA cleanup levels. Ranges of detected concentrations of Phase I target analytes were as follows:

- TPHg - 0.026 to 0.39 mg/kg (cleanup level of 100 mg/kg)
- TPHd – 1.3 to 30 mg/kg (cleanup level of 115 mg/kg)
- TPHfo – 9.4 to 57 mg/kg (cleanup level of 160 mg/kg)
- Benzene – 0.0026 to 0.0043 mg/kg (cleanup level of 0.005 mg/kg)
- Toluene – 0.002 to 0.037 mg/kg (cleanup level of 1 mg/kg)
- Ethylbenzene – 0.0055 mg/kg (cleanup level of 13 mg/kg)
- Xylenes – 0.0046 to 0.027 mg/kg (cleanup level of 33 mg/kg)
- Lead – 2.4 to 27 mg/kg (cleanup level of 400 mg/kg).

As discussed in Section 3.0, TPHg results for a confirmation floor sample 1065EX234(9.5) were qualified as rejected. This sample lies within the footprint of the planned below grade water storage tank and soil in this area will be removed as part of installation of the tank.

5.2 Completed Excavation

The completed excavation dimensions were approximately 130 by 95 feet and excavation depths ranged from 9 to 12 feet bgs (elevations of 8 to 5 feet relative to NGVD29). As-built drawings of the completed

excavation are presented as Exhibit 2 in Appendix B. Based on topographic surveys conducted prior to and following excavation, an estimated 3100 cubic yards of soil were removed as part of the Phase I excavation. The excavation was backfilled to grade below the footprint of Birmingham Road, but the footprint of the water storage tank was not backfilled. Based on topographic surveys conducted prior to and after backfilling, an estimated 890 cubic yards of 1½ inch crushed rock and Class II aggregate base were used as backfill. As-built drawings of the backfilled excavation are presented as Exhibits 3 and 4 in Appendix B.

µg/l	Micrograms per liter
mg/l	Milligrams per liter
N/A	Not applicable, no discharge limit for this analyte.
ND(0.05)	Not detected at reporting limit indicated in parentheses

Laboratory Assigned Qualifiers

/J	The analyte was positively identified; the associated numerical value is the approximate the analyte in concentration of the sample.
/U	The analyte was analyzed for, but was not detected above the reported sample quantitation limit.

Footnotes

(a) The following VOCs were not detected at a reporting limit of 0.5 ug/l: 1,1,1-Trichloroethane, 1,1,2,2-Tetrachloroethane, 1,1,2-Trichloroethane, 1,1-Dichloroethane, 1,1-Dichloroethene, 1,2-Dichloroethane, 1,2-Dichloroethene (cis & trans), 1,2-Dichloropropane, 1,3-Dichloropropene (cis), 1,3-Dichloropropene (trans), Bromodichloromethane, Bromoform, Chlorobenzene, Chloroethane, Chloromethane, Carbon tetrachloride, Dibromochloromethane, Methyl-tert-butyl ether, Methylene chloride, Styrene, Trichloroethene, Vinyl chloride, and Xylenes (o-)

(b) The following VOCs were not detected at a reporting limit of 5.0 ug/l: 2-Butanone, 2-Hexanone, 4-Methyl-2-pentanone, Carbon disulfide, and Vinyl acetate

(c) Bromomethane was not detected at a reporting limit of 1 ug/l.

(d) Not withstanding any regulatory limit that may be identified with this pollutant/pollutant property, this parameter defines the characteristic of the discharge that, in part, is used in the calculation of sewer service charges.

Iron	--	--	
Lead	400	500	Presidio-Wide Cleanup Level Document
Magnesium	--	--	Presidio-Wide Cleanup Level Document
Manganese	1,800	19,000	Presidio-Wide Cleanup Level Document
Mercury	20	52	Presidio-Wide Cleanup Level Document
Molybdenum	360	870	Presidio-Wide Cleanup Level Document
Nickel	1,400	3,500	Presidio-Wide Cleanup Level Document
Potassium			Presidio-Wide Cleanup Level Document
Selenium	360	870	Presidio-Wide Cleanup Level Document
Silver	360	870	Presidio-Wide Cleanup Level Document
Sodium	--	--	
Thallium	5.7	14	Presidio-Wide Cleanup Level Document
Vanadium	650	1,600	Presidio-Wide Cleanup Level Document
Zinc	22,000	52,000	Presidio-Wide Cleanup Level Document

mg/kg	Milligrams per kilogram.
RWQCB ESL	Regional Water Quality Control Board Environmental Screening Level (RWQCB, 2003).
PRG	Preliminary Remediation Goal (*USEPA, 2002*).

[a] All potentially detected chemicals in soil at the Building 1065 Area are listed.

[b] Cleanup levels selected from the following order of preference:

1) Presidio-wide Cleanup Level Document (*EKI, 2002*), Tables 7-2 and 7-5.

Table 3. Cleanup Levels for Soil
Completion Report, Phase I Interim Action
Building 1065 CAP Area
Presidio of San Francisco, California

Chemical [a]	Protection of Groundwater/Residential Land Use Cleanup Level (mg/kg)	Protection of Groundwater/ Commercial/ Recreational Land Use Cleanup Level (mg/kg)	Source of Cleanup Level [b]

2) RWQCB soil ESL (lowest of human toxicity and indoor air impacts) (*RWQCB, 2003*).

3) Soil PRG (*USEPA, 2002*).

(gw) - From Table 7-5 of Cleanup Level Document - Cleanup Level for Soil to Maintain Drinking Water Standard in Groundwater (less than 5 feet above groundwater).

(bk) - From Table 7-2 of Cleanup Level Document - Presidio Background Metals Concentration - Beach/Dune Sand. Background values were selected as cleanup levels because background values were higher than Presidio residential human health PRGs.

-- For chemicals with no cleanup levels, there are no Presidio cleanup levels, RWQCB ESLs, or USEPA PRGs.

Source	Qualifier	Description
Laboratory Assigned Qualifiers		
	/U	The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
	/J	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
MACTEC Validation Assigned Qualifiers (Please see Table H2, Appendix H for reason for application of qualifier during data validation)		
	J-	The analyte was positively identified; the associated numerical value is biased low and should be considered an approximate concentration of the analyte in the sample.
	J+	The analyte was positively identified; the associated numerical value is biased high and should be considered an approximate concentration of the analyte in the sample.
	U	The analyte was analyzed for, but was not detected above the reported sample quantitation limit.

a. Residential land use cleanup level
b. Commercial/recreational land use cleanup level
c. Background levels selected as cleanup levels because background levels were higher than Presidio residential PRGs
d. Cleanup level for soil to maintain drinking water standard in groundwater
e. Antimony and Thallium were analyzed for but were not detected.
f. The following VOCs were not detected by EPA 8260B: 1,1,1-Trichloroethane, 1,1,2,2-Tetrachloroethane, 1,1,2-Trichloroethane, 1,1-Dichloroethane, 1,1-Dichloroethene, 1,2-Dichloroethane, 1,2-Dichloroethene (cis & trans), 1,2-Dichloropropane, 1,3-Dichloropropene (cis), 1,3-Dichloropropene (trans), 1,2-Dichloropropane, 1,3-Dichloropropene (cis), 1,3-Dichloropropene (trans), 2-chloroethylvinyl ether, 2- hexanone, 4-methyl-2-petanone, Bromodichloromethane, Bromoform, Bromomethane, Carbon disulfide, Chlorobenzene, Chloroethane, Chloromethane, Chloroform, Carbon tetrachloride, Dibromochloromethane, Ethylbenzene, Methyl-tert-butyl ether, Methylene chloride, Styrene, Tetrachloroethene, Trichloroethene, Vinyl acetate, Vinyl chloride, Xylenes (m&P), and Xylenes (o-).

Table 7. Detected Compounds in Final Excavation Confirmation Soil Samples
Completion Report, Phase I Interim Action
Building 1065 CAP Area
Presidio of San Francisco, California

Source	Qualifier	Description
Laboratory Assigned Qualifiers		
	/U	The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
	/J	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
MACTEC Validation Assigned Qualifiers (Please see Table H2, Appendix H for reason for application of qualifier during data validation)		
	J-	The analyte was positively identified; the associated numerical value is biased low and should be considered an approximate concentration of the analyte in the sample.
	J+	The analyte was positively identified; the associated numerical value is biased high and should be considered an approximate concentration of the analyte in the sample.
	U	The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
	R	The sample results are qualified as rejected due to serious deficiences in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

Footnotes

a. Residential land use cleanup level

b. Commercial/recreational land use cleanup level

c. Background levels selected as cleanup levels because background levels were higher than Presidio residential PRGs

d. Cleanup level for soil to maintain drinking water standard in groundwater

e. Antimony was analyzed for by EPA 6020, but was not detected.

f. The following VOCs were not detected by EPA 8260B: 1,1,1-Trichloroethane, 1,1,2,2-Tetrachloroethane, 1,1,2-Trichloroethane, 1,1-Dichloroethane, 1,1-Dichloroethene, 1,2-Dichloroethane, 1,2-Dichloroethene (cis & trans), 1,2-Dichloropropane, 1,3-Dichloropropene (cis), 1,3-Dichloropropene (trans), 1,2-Dichloropropane, 1,3-Dichloropropene (cis), 1,3-Dichloropropene (trans), 2-chloroethylvinyl ether, 4-methyl-2-petanone, Bromodichloromethane, Bromoform, Bromomethane, Carbon disulfide, Chlorobenzene, Chloromethane, Chloroform, Carbon tetrachloride, Dibromochloromethane, Methyl-tert-butyl ether, Styrene, Tetrachloroethene, Trichloroethene, Vinyl acetate, and Vinyl chloride

Table 8. Daily Log of Field Activities
Completion Report, Phase I Interim Action
Building 1065 CAP Area
Presidio of San Francisco, California

Day	Date	Activity
Mon	November 10	Mobilization - Heavy equipment, sand bags, polyethylene sheeting delivered and fencing installed. Breaking up and stockpiling of asphalt and concrete. Power turned off to Building 1063 and the Former Building 1065 pump island. Water turned off to Former Building 1065. Surveyors onsite to identify control for pre-excavation survey.
Tues	November 11	Continued breaking up and stockpiling asphalt and concrete. Asphalt and concrete off-hauled (12 loads). Asbestos-lined metal pipes removed from Building 1065 retaining wall. Retaining wall demolished.
Wed	November 12	Pre-excavation survey performed. Continued breaking up and stockpiling asphalt. Asphalt and concrete off-hauled (3 loads). Construction of stockpile containment areas began. Concrete sump encountered in excavation and removed. Received Trust authorization to remove a shallow storm drain on the north end of the excavation parallel to Building 1063.
Thurs	November 13	Trust electrician cut power lines at Buildings 1040 and 1063. Buried retaining wall, 55-gallon drum, hydraulic hoist encountered in excavation and removed. Two loads of debris off-hauled. Soil excavation began on west side of Phase I IA area.
Fri	November 14	Soil excavation continued. Asbestos-wrapped pipes were encountered near northeast corner of excavation. Pipes were cut and removed. One load of debris off-hauled. Excavation stopped mid-day due to rain.
Mon	November 17	Soil excavation continued. Asbestos-wrapped pipes were encountered near eastern edge of the excavation. Pipes were cut and removed. Active clay storm drain parallel to northern edge of the excavation was encountered in area of contamination. Received authorization from Trust to cut and replace. Building 1062 concrete sump walls and floor removed. Area adjacent to the foundation of Building 1062 was backfilled immediately with crushed concrete from the former sump excavation. Excavation confirmation samples 1065EX214(9.5) and 1065EX219(7.5) were collected.
Tues	November 18	Soil excavation continued. An abandoned steam line was encountered on the east side of excavation. A clay sewer line was encountered and removed from the northern edge of the excavation. A concrete utility trench was encountered and removed from the southeast corner of the excavation, parallel to Building 1062. Excavation confirmation samples 1065EX215(8.5), 1065EX216(7.5), and 1065EX218(10.0) were collected.
Wed	November 19	Soil excavation continued. Perimeter air monitoring initiated. Stockpiles covered during working hours because of complaints of odor. A 250-gallon UST (Tank 1065.4) was encountered south of the former UST excavation. Excavation confirmation soil samples 1065EX220(9.0), DUP(031119), 1065EX217(9.5), 1065EX221(9.5), and 1065EX238(6.5) were collected.

Table 8. Daily Log of Field Activities
Completion Report, Phase I Interim Action
Building 1065 CAP Area
Presidio of San Francisco, California

Day	Date	Activity
Thurs	November 20	Soil excavation continued. Asbestos-wrapped steam lines encountered and removed from the northeast corner of the excavation. Clay pipe exposed on north excavation sidewall. Pipe was removed and plugged where it went into the excavation sidewall. Additional bermed stockpile area constructed. Fluid was pumped out from the UST and transferred to two 55-gallon drums. Perimeter air monitoring performed. Confirmation samples 1065EX200(5.0), 1065EX201(5.5), 1065EX222(5.5), 1065EX229(6.0), DUP(031120), and 1065EX239(4.5) were collected.
Fri	November 21	Soil excavation continued. Over-excavation of floor based on elevated PID readings. One load of concrete off-hauled. Perimeter air monitoring performed. Excavation confirmation soil samples 1065EX202(5.5), 1065EX223(9.5), 1065EX224(6.5), 1065EX225(10.5) were collected.
Mon	November 24	Tank 1065.4 removed under supervision of SF Fire Department and SF Department of Public Health. Excavation confirmation samples 1065EX203(6.5), 1065EX204(6.0), 1065EX226(11.0), and 1065EX227(7.5) were collected.
Tues	November 25	Well 1065TMW3 removed. Perimeter air monitoring performed. Excavation confirmation samples 1065EX210(9.0), 1065EX211(9.0), 1065EX228(13.0), and 1065EX230(6.5) were collected.
Wed	November 26	Removal of hot spots from floor of excavation.
Mon	December 1	Confirmation samples 1065EX205(5.5), 1065EX206(8.0), 1065EX207(8.0), 1065EX209(8.0), 1065EX231(9.0), DUP(031201), 1065EX232(6.0), 1065EX233(9.5), 1065EX234(9.5), and 1065EX235(9.5) were collected.
Mon	December 8	Water sample 1065WW200 collected from wastewater pumped from excavation. Excavation soil samples 1065EX208(8.0), DUP(120803), 1065EX236(9.0), 1065EX237(9.5), 1065EX213(9.5), 1065EX243(8.0) collected from excavation following removal of additional soil from northwest sidewall.
Friday	December 12	Authorization from Trust to discharge wastewater from storage tanks to sanitary sewer.
Wed	December 17	Confirmation soil sample 1065EX248(9) was collected from excavation following removal of soil from west sidewall.
Thur	December 18	Potholing (3 areas). Confirmation soil samples 1065EX240(3), 1065EX241(5), DUP(121803), 1065EX242(5) were collected from the three potholes.
Mon	December 29	Collected samples of Potrero Hills backfill material, submitted for testing by ASTM D1557 and for TPHg, BTEX, metals, pesticides, and PCBs.

Table 8. Daily Log of Field Activities
Completion Report, Phase I Interim Action
Building 1065 CAP Area
Presidio of San Francisco, California

Day	Date	Activity
Mon	January 26	Sample collected of Lake Hermann Quarry backfill submitted for testing by ASTM D1557 and for TPHg, TPHd and Title 22 metals.
Tues	January 27	Final excavation survey
Thurs	January 29	Began backfilling excavation. Two field density tests performed.
Fri	January 30	Contaminated soil removed from sidewalls and floor adjacent to Building 1062. Backfilled immediately following removal of soil and collection of confirmation soil samples1065EX244(6.5) and 1065EX247(10.5). Continued backfilling excavation. Three field density tests performed
Mon	Feb 2	Dewatering equipment demobilized.
Tues	Feb 3	Final post-grading survey performed.
Wed	Feb 4	Dewatering equipment demobilized, backhoe demobilized.
Tues	February 17	Excavator demobilized.
Tues	February 24	Soil off hauled. Collected sample of water WW101 in drums containing UST fluids.
Thurs	June 17	Drummed wastewater disposed by Clearwater Environmental.

C.0 APPENDIX C
TANK 1065.4 REMOVAL REPORT

The following presents a summary of activities performed in conjunction with the removal of an underground storage tank (UST) from the Phase I Interim Action (IA) Area at the Building 1065 Corrective Action Plan (CAP) Area, the Presidio of San Francisco, California. This report has been prepared and the UST removed on behalf of the Presidio Trust (Trust).

C1.0 Background

Between November 7, 2003 and March 2, 2004, the Trust performed an IA at the Building 1065 CAP site to remove petroleum-contaminated soil in and around where a below grade water storage tank is planned to be constructed. Soil excavation and waste profiling and disposal were performed by Performance Excavators, San Rafael, California under contract to the Trust. Field activities were supervised and documented and confirmation soil and wastewater samples were collected by a MACTEC geologist.

During excavation and removal activities at the Phase I IA Area, an undocumented, inactive UST (Tank 1065.4) was encountered. The UST was encountered where three former gasoline and diesel USTs were formerly located. These USTs comprised one 375 gallon UST (Tank 1065.3) and two 550 gallon tanks (Tanks 1065.1 and 1065.2). These USTs were associated with former Building 1064, which served as the Post Exchange service station. These USTs were removed by IT Corporation in September 1996 (*MW, 1997*).

C2.0 Summary of Field Activities

The following summarizes field activities associated with removal of Tank 1065.4.

C2.1 Discovery of UST

On November 19, 2003, during Phase I IA soil excavation activities, a UST (Tank 1065.4) was encountered in the southern part of the excavation. Soil was removed from around the UST to expose the tank walls without removing it from the excavation. The top of the tank was approximately 4 feet below ground surface. The UST was cylindrical, constructed of riveted steel, and was 3.2 feet in diameter and 4.0 feet long; no leaks were observed in the UST. Estimated capacity of the UST was 250 gallons. The vent riser and piping appeared to have been cut during a previous activity, and there were no visual cues to its existence until the excavator unearthed it. What remained of the vent riser and piping were broken off or bent over by the excavator bucket during digging. A photoionization detector (PID) reading taken at the point where the vent riser previously attached to the tank indicated a value of 55 parts per million (ppm) in the tank's headspace. Fluid was visible through the openings at the top of the tank, and a stainless steel bailer was lowered into the tank to visually observe the fluid contained in the UST. The fluid in the bailer consisted of slightly turbid water with a strong fuel odor and sheen. Based on the sample collected in the bailer, there appeared to be a small amount of sediment at the bottom of the tank. On November 20, 2003, the water was pumped out of the UST into two 55-gallon drums, which were staged onsite.

C2.2 Permitting

The Trust submitted a Work Plan (*MACTEC, 2003*) and Underground Storage Tank Application to the San Francisco Department of Public Health (SFDPH) and the City of San Francisco Fire Department (SFFD) on November 20, 2003. Copies of the permit applications are attached.

C2.3 UST Removal

On November 24, 2003, the UST was removed by Performance Excavators under the supervision of the SFDPH and SFFD. The PID reading within the empty tank was 25 ppm, and the PID reading in the surrounding soil was 40 ppm. Soil was further removed from around the UST

using a backhoe. The UST was then filled with dry ice to purge any vapors remaining in the tank. After placement of the dry ice, the lower explosive limit (LEL) measurement in the UST was 4% and oxygen was 5.5%. After receiving authorization from the SFFD, the UST was removed from the excavation using the backhoe, loaded onto a truck, transported by Ecology Control Industries (ECI) (a licensed hauler) and disposed at an ECI facility in Richmond, California. ECI's Richmond Facility is permitted to provide UST decontamination and reclamation.

Pea gravel backfill from the former UST footprint and visibly contaminated soil were excavated and removed from the area surrounding and directly underneath the former UST. Confirmation soil sample 1065EX226(11.0) was collected at 11 feet below ground surface, directly underneath the former UST. The sample was submitted (along with other confirmation samples from the excavation) under chain of custody control to Sequoia Analytical Laboratories for analysis for total petroleum hydrocarbons (TPH) as gasoline (g), diesel (d), and fuel oil (fo) (EPA Test Method 8015D) TPHd, TPHfo, volatile organic compounds (VOCs; EPA Test Method 8260B, and Title 22 metals (EPA Test Methods 6010/6020/7471).

On February 24, 2004, drums containing water from the UST were transferred to the Central Magazine area for storage, at which time they were sampled. The sample (WW101) was submitted to Sequoia for total petroleum hydrocarbons TPHg, TPHd (EPA Test Method 8015D), and VOCs (EPA Test Method 8260B).

C3.0 Summary of Analytical Results

Table C1 presents a summary of compounds detected in the confirmation sample collected beneath the UST (1065EX226[11.0]). The laboratory report for 1065EX226(11.0) along with other confirmation samples collected from the excavation is attached.

Analytical results for the soil confirmation sample show that TPHg, TPHd, and TPHfo were not detected. Detected concentrations of VOCs and metals were below Presidio cleanup levels.

Table C2 presents detected compounds in the drummed water sample (Sample WW101). The laboratory analytical report is attached. Analytical results show that the drummed water contains TPHd and TPHg at 30 and 25 mg/L and VOCs.

C4.0 Disposition of Soil and Wastewater

Drums containing water from the UST were transferred to the Central Magazine area for storage. The water was disposed by Clearwater Environmental on June 17, 2004. A copy of the manifest is attached to this report..

Soil surrounding the UST was removed and staged in stockpiles with other similarly contaminated soil from the Phase I IA excavation. Soil stockpiles were sampled by Performance Excavators and transported offsite to Hay Road Landfill, Vacaville, California (Class II Facility) and Ox Mountain Landfill, Half Moon Bay, California (Class III Facility).

C5.0 Excavation Backfilling

The Phase I IA Area, including the former location of Tank 1065.4, is fenced and inaccessible to the public. The excavation in the vicinity of former Tank 1065.4 was not backfilled because it is located where a planned below grade storage tank will be constructed. Additional soil will be removed from this area as part of construction of the below grade storage tank.

* If Closure in Place, submit subsurface investigative report and indicate the type and amount of material for filling tank in the Work Plan.

** If tank or pipe is located under a street or sidewalk, an encroachment permit must be obtained from the Department of Public Works, Bureau of Street-Use and Mapping prior to start of any work.

*** If tank is to be cleaned and cut on-site, comply with San Francisco Fire Department requirements for on-site cutting. Attach a copy of the Welding and Cutting Permit for open flame torch issued by the San Francisco Fire Department, where applicable.

3. MAP Provide a site map indicating the location of the UST(s) relative to a fixed structure, the location of the UST fill, the orientation of the UST, North directional arrow and any street or cross streets.

4. TANK FORMS Attach a *State Water Resources Control Board, UST "Tank Form" (HMUPA 604)* for **each** tank.

5. WORK PLAN Submit a description of the work to be performed. Include the procedures for cleaning the UST and evaluating the condition of the soil and groundwater.

6. CONTRACTOR/CONSULTANT INFORMATION Contractors performing or subcontracting tank closure must possess a proper contractor license and a valid Hazardous Substance Removal Certification (HAZ/CERT) issued by the Contractors State License Board. Approval for tank work will not be granted unless copies of the contractor's license and certifications are on file with the San Francisco Department of Public Health.

PRIMARY CONTRACTOR/CONSULTANT BUSINESS NAME	CALIF. CONTRACTORS LICENSE CLASSIFICATION AND NO.	PHONE NUMBER	
PERFORMANCE EXCAVATORS	A-HAZ 667433	(415) 793 3845

8. PUMP INFORMATION Provide information on the pump equipment that will be used to make the tank free of any product prior to transportation. Also, an ground water, which may be present in the tank excavation, must be removed and allowed to recharge prior to taking any water samples.

PUMP TRUCK COMPANY NAME OR NAME OF EQUIPMENT MANUFACTURER	US EPA ID NO. (IF APPLICABLE)	PHONE NUMBER
NA		( )

* All pumping equipment must be third party certified for use in a combustible/flammable atmosphere.

9. HAZARDOUS WASTE INFORMATION INDICATE where tank(s) will be taken for disposal and the name of the company transporting the tanks. All hazardous waste including tanks must comply with applicable hazardous waste regulations for transportation, treatment and disposal. A *Uniform Hazardous Waste Manifest* completed by the Generator must accompany all generated hazardous waste during transportation. Attach separate sheet for additional hazardous waste or contaminated materials generated by the tank closure. Copies of the Hazardous Waste Manifest or other transportation documents shall be submitted as part of the final tank closure report.

In signing this application the applicant declares:

- That the above information is complete and accurate. Any deviation from the approved plan without prior approval from the San Francisco Department of Public Health may result in the revocation of the approval and an assessment of fines and penalties.
- That I have read the San Francisco Department of Public Health's guidelines and that such guidelines do not relieve my obligation to comply with other pertinent State and Federal laws and regulations.
- That I will contact the San Francisco Department of Public Health, Hazardous Materials Unified Program Agency, and where required, San Francisco Fire Department, Department of Public Works or Port Authority, a minimum of 3 (three) working days in advance to schedule inspection appointments.
- Documents relating to tank closure must be submitted within 90 (ninety) days of removing/closing an underground storage tank. All other tank modification, installation, and/or upgrades documents or reports must be submitted within 30 (thirty) days of project completion. Refer to San Francisco Department of Public Health guidelines for specific reporting requirements.
- That in the event an unauthorized release (leak) is detected and confirmed, the business, tank, or property owner, or I, on behalf of the business, tank, or property owner will notify the San Francisco Department of Public Health within 24 (twenty-four) hours. In addition, an *Underground Storage Tank Unauthorized Release (Leak)/Contamination Site Report* shall be completed and submitted to the San Francisco Department of Public Health within 5 (five) days.
- The Applicant will be billed for any additional San Francisco Department of Public Health inspection charges. All such charges shall be paid in full immediately upon receipt of the invoice.
- The Applicant understands that a separate permit and approval may be required by the San Francisco Fire Department and the Department of Public Works and no removal work may take place until all appropriate permits or approvals have been obtained.

Notes and Definitions

J	Estimated value.
Q-LIM	The percent recovery was outside of the control limits. The samples results may still be useful for their intended purpose.
QM-RX	The spike recovery was outside control limits for the MS and/or MSD due to matrix interference. Re-extraction/re-analysis performed to confirm original MS/MSD results.
QR-07	The RPD was outside control limits. The results may still be useful for their intended purpose.
R-05	The sample was diluted due to the presence of high levels of non-target analytes resulting in elevated reporting limits.
RA	The result is from re-extraction and re-analysis to confirm original MS/MSD result.
S-LIM	The surrogate recovery was outside control limits. The result may still be useful for its intended purpose.
DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the reporting limit
NR	Not Reported
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference

The results in this report apply to the samples analyzed in accordance with the chain of custody document. Unless otherwise stated, results are reported on a wet weight basis. This analytical report must be reproduced in its entirety.

Notes and Definitions

A-01	Results in the Diesel organic range (C10-C24) are elevated due to the presence of high amounts of lower boiling point fuel hydrocarbons. Conclusive identification of diesel in this sample is not possible.
J	Estimated value.
DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the reporting limit
NR	Not Reported
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference

The results in this report apply to the samples analyzed in accordance with the chain of custody document. Unless otherwise stated, results are reported on a wet weight basis. This analytical report must be reproduced in its entirety.

Dear Mr. Goldsbrough,

Attached is our report for your samples received on 11/21/2003 12:20
This report has been reviewed and approved for release. Reproduction of this report is permitted only in its entirety.

Please note that any unused portion of the samples will be discarded after 01/05/2004 unless you have requested otherwise.
We appreciate the opportunity to be of service to you. If you have any questions, please call me at (925) 484-1919.
You can also contact me via email. My email address is: vvancil@stl-inc.com

Sincerely,

Vincent Vancil

Legend and Notes

Result Flag

g

Hydrocarbon reported in the gasoline range does not match our gasoline standard.

sh

Surrogate recovery was higher than QC limit due to matrix interference.

QUALITY CONTROL SUMMARY REPORT

Checked MJH

Approved MJH

TO: Mary Jo Heassler, Mactec E & C, Inc. June 23, 2004

FROM: Donna Breaux, DataVal, Inc. Mactec Project No. 4089030006 00123

REPORT AMENDED FROM ORIGINAL DATED MAY 3, 2004

QUALITY CONTROL SUMMARY REPORT FOR THE BUILDING 1065 SITE, THE PRESIDIO OF SAN FRANCISCO, CA

LABORATORY: Sequoia Analytical, Petaluma, CA

SAMPLING DATES: November 17, 18, 19, 20, 21, 24 and 25, 2003; December 1, 8, 17 and 18, 2003; and January 23, 26 and 30, 2004

Data validation of Levels III and IV laboratory data packages was performed according to the project-specific guidelines. These guidelines were outlined in the Presidio-wide Quality Assurance Project Plan, Sampling and Analysis Plan, April, 2001; the U. S. Environmental Protection Agency Contract Laboratory Program National Functional Guidelines for Organic Data Review, October, 1999; and the U. S. Environmental Protection Agency Contract Laboratory Program National Functional Guidelines for Inorganic Data Review, July 2002.

The data were reviewed for holding times, blanks, GC/MS tunes, initial calibrations, continuing calibration verification (CCV) standards, internal standards, laboratory control samples (LCS), surrogate recoveries, matrix spikes (MS), matrix spike duplicates (MSD), laboratory duplicates, ICP interference check standards, ICP serial dilutions, compound identification and quantitation, and field duplicate samples.

The following paragraphs highlight the essential findings of the data validation effort:

I. **Volatile Organic Compounds (VOCs) by GC/MS (8260B)**

Overall, the data are usable as reported with any added qualifiers. Qualifications were required for the reasons noted in sections C, E, F and I.

A. Reporting Limits

The laboratory reporting limits for VOCs in soil and water matrices met the project required reporting limits, with the following exceptions:

1. The laboratory reporting limits did not meet the project required reporting limits listed in Table 2-6.8-1 of the QAPP for acetone and carbon disulfide in soil matrix; and bromomethane and 1,2-dichloroethene (total) in water matrix. In order to meet the project required reporting limits, the laboratory reported all VOC detects below the reporting limit and above the method detection limit (MDL). Those detects were flagged as 'J' by the laboratory and should be considered estimated values.
2. The reporting limits for all soils were raised due to dry weight correction.

B. Holding Times

Technical holding time criteria were met for all project samples.

C. Blanks

Target analytes were not observed in any laboratory method blanks or field QC blanks associated with the project samples, with the following exceptions:

1. Laboratory method blank 3110518-BLK1 had detected levels of acetone (6.4 ug/kg) and 2-butanone (1.8 ug/kg). The results for acetone and 2-butanone in the associated samples were changed to non-detect (U) if those results were less than five times the blank amounts.
2. Laboratory method blank 3110562-BLK1 had a detected level of 2-butanone at 1.8 ug/kg. The results for 2-butanone in the associated samples were changed to non-detect (U) if those results were less than five times the blank amount.
3. Laboratory method blank 3120144-BLK1 had a detected level of 2-butanone at 0.76 ug/L. The associated samples were non-detect for 2-butanone, and qualification was not required.
4. Laboratory method blank 3110611-BLK1 had a detected level of 2-hexanone at 3.4 ug/kg. The associated samples were non-detect for 2-hexanone, and qualification was not required.
5. Laboratory method blank 3120096-BLK1 had a detected level of methylene chloride at 3.7 ug/kg. The results for methylene chloride in the associated samples were changed to non-detect (U) if those results were less than five times the blank amount.
6. Laboratory method blank 3120258-BLK1 had detected levels of 2-butanone (451 ug/kg) and 1,2-dichloroethane (109 ug/kg). The results for 2-butanone in the associated samples were changed to non-detect (U) if those results were less than five times the blank amount. The associated samples were non-detect for 1,2-dichloroethane, and qualification was not required.
7. Laboratory method blank 3120537-BLK1 had a detected level of acetone at 4.2 ug/kg. The results for acetone in the associated samples were changed to non-detect (U) if those results were less than five times the blank amount.
8. Laboratory method blank 3120751-BLK1 had detected levels of chloroform (0.15 ug/L) and trichloroethene (0.10 ug/L). The results for chloroform and trichloroethene in the associated samples were changed to non-detect (U) if those results were less than five times the blank amounts.
9. Laboratory method blank 3120786-BLK1 had a detected level of chloroform at 0.094 ug/L. The results for chloroform in the associated samples were changed to non-detect (U) if those results were less than five times the blank amount.

10. Equipment blank 222RB223 had detected levels of acetone (2.3 ug/L), chloroform (0.18 ug/L) and methylene chloride (0.15 ug/L). The values were converted to solid matrix units and the project samples were evaluated for blank contamination. All associated project samples were non-detect for chloroform and methylene chloride, and qualification was not required. The results for acetone in the associated samples were changed to non-detect (U) if those results were less than five times the blank amount.
11. Trip blank TB031121 had a detected level of acetone at 1.9 ug/L. The value was converted to solid matrix units and the project samples were evaluated for blank contamination. The results for acetone in the associated samples were changed to non-detect (U) if those results were less than five times the blank amount.
12. Equipment blank 237RB248 had detected levels of chloroform (0.21 ug/L), methylene chloride (0.11 ug/L) and trichloroethene (0.093 ug/L). The values were converted to solid matrix units and the project samples were evaluated for blank contamination. All associated project samples were non-detect for chloroform, methylene chloride and trichloroethene, and qualification was not required. It should be noted that the detected result for chloroform in this equipment blank was changed to non-detect due to contamination in the associated laboratory method blank.
13. Trip blank TB(121703) had detected levels of chloroform (0.17 ug/L) and trichloroethene (0.18 ug/L). The values were converted to solid matrix units and the project samples were evaluated for blank contamination. All associated project samples were non-detect for chloroform and trichloroethene, and qualification was not required. It should be noted that the detected results for chloroform and trichloroethene in this trip blank were changed to non-detect due to contamination in the associated laboratory method blank.

See Table H2 of this report for a summary of qualifications due to blank contamination.

D. GC/MS Tunes

All QC criteria were met for the GC/MS tunes associated with the project samples.

E. Initial Calibration

Initial calibration criteria were met for all calibration standards associated with the project samples, with the following exceptions:

1. The 12/9/03 initial calibration analyzed on instrument MSV03 had two compounds with average relative response factors (RRF) less than 0.05, acetone (0.045) and vinyl acetate (0.045). The results for acetone and vinyl acetate in the associated samples were non-detect and qualified as rejected (R) due to minimum average RRF failure.

See Table H2 of this report for a summary of qualifications due to initial calibration minimum RRF failure.

F. Continuing Calibration

Continuing calibration criteria were met for all continuing calibration standards associated with the project samples, with the following exceptions:

1. Continuing calibration standards that failed high and were associated with samples that were non-detect for the failing compounds, did not require qualification and are not noted in this report.
2. The 11/19/03 at 23:15 soil matrix continuing calibration verification standard (CCV) analyzed on instrument MSVOA05, had one compound with a percent difference (%D) greater than +25%: acetone (+31%). The detected results for acetone in the associated samples were qualified as estimated with a high bias (J+).
3. The 12/5/03 at 10:39 water matrix CCV analyzed on instrument MSVOA05, had one compound with a %D less than -25%: carbon disulfide (-29%). The associated samples were non-detect for carbon disulfide, and were qualified as estimated (UJ).
4. The 11/26/03 at 18:42 soil matrix CCV analyzed on instrument MSVOA05, had one compound with a %D less than -25%: acetone (-26%). The detected result for acetone in the associated sample was qualified as estimated with a low bias (J-).
5. The 12/2/03 at 09:41 soil matrix CCV analyzed on instrument MSVOA05, had one compound with a %D less than -25%: acetone (-27%). The detected results for acetone in the associated samples were qualified as estimated with a low bias (J-).
6. The 12/3/03 at 09:47 soil matrix CCV analyzed on instrument MSVOA05, had one compound with a %D less than -25%: acetone (-26%). The detected result for acetone in the associated sample was qualified as estimated with a low bias (J-).
7. The 12/9/03 at 08:20 soil matrix CCV analyzed on instrument MSVOA05, had four compounds with a %D less than -25%: bromomethane (-30%), acetone (-42%), 2-butanone (-32%) and 2-chloroethyl vinyl ether (-44%). The results for bromomethane, acetone, 2-butanone and 2-chloroethyl vinyl ether in the associated samples were qualified as estimated with a low bias (J-/UJ).
8. The 12/30/03 at 20:03 water matrix CCV analyzed on instrument MSVOA03, had one compound with a %D less than -25%: bromomethane (-56%). The associated sample was non-detect for bromomethane, and was qualified as estimated (UJ).
9. The 12/18/03 at 16:03 soil matrix CCV analyzed on instrument MSVOA05, had one compound with a %D less than -25%: acetone (-26%). The results for acetone in the associated samples were qualified as estimated with a low bias (J-/UJ).
10. The 1/27/04 at 08:04 soil matrix CCV analyzed on instrument MSVOA05, had two compounds with a %D less than -25%: bromomethane (-28%) and methylene chloride (-28%). The results for bromomethane and methylene chloride in the associated samples were qualified as estimated with a low bias (J-/UJ).

11. The 2/4/04 at 09:22 soil matrix CCV analyzed on instrument MSVOA05, had one compound with a %D less than -25%: 2-chloroethyl vinyl ether (-41%). The associated samples were non-detect for 2-chloroethyl vinyl ether, and were qualified as estimated (UJ).

See Table H2 of this report for a summary of qualifications due to continuing calibration percent difference failure.

G. Matrix Spike/Matrix Spike Duplicate

All QC criteria were met for the matrix spikes and matrix spike duplicates associated with the project samples.

H. Laboratory Control Samples

All QC criteria were met for the laboratory control samples associated with the project samples.

I. Surrogate Recoveries

Surrogate spike recoveries met QC acceptance criteria for all project samples, with the following exceptions:

1. Surrogate recoveries that failed in samples that required dilutions of 5X or greater did not require qualification and are not noted in this report.
2. The percent recoveries for surrogates 1,2-dichloroethane-d4 and toluene-d8 were outside the project acceptance criteria in sample 222RB223 (P311474-03) at 131% and 86%, respectively. The results in this sample were qualified as estimated (J-/UJ).
3. The percent recovery for surrogate 1,2-dichloroethane-d4 was outside the 76%-114% project acceptance criteria in sample TB031121 (P311474-04) at 125%. The detected results in this sample were qualified as estimated with a high bias (J+).
4. The percent recovery for surrogate 4-bromofluorobenzene was outside the 59%-113% project acceptance criteria in sample 1065EX226(11.0) (P311511-01) at 114%. The detected results in this sample were qualified as estimated with a high bias (J+).
5. The percent recovery for surrogate 4-bromofluorobenzene was outside the 59%-113% project acceptance criteria in sample 1065EX230(6.5) (P311553-04) at 114%. The detected results in this sample were qualified as estimated with a high bias (J+).

See Table H2 of this report for a summary of qualifications due to surrogate recovery failure.

J. Internal Standards

Internal standard areas and retention times met QC acceptance criteria for all project samples.

K. Compound Identification and Quantitation

For the samples that received full data validation, no problems were observed with compound identification and quantitation. Samples 1065EX214(9.5) (P311384-01), 1065EX219(7.5) (P311384-02), 1065EX215(8.5) (P311384-03), 1065EX216(7.5) (P311384-04) and 1065EX218(10.0) (P311384-05) received full (Level IV) data validation. This included re-calculation of GC/MS tunes, initial and continuing calibrations, surrogate values, and internal standard areas; in addition to re-calculation of all reported results for these samples. In the samples that received full data validation, all recalculated results were verified to match those reported by the laboratory.

II. Total Petroleum Hydrocarbons - TPH-Gasoline Range (8015B)

Overall, the data are usable as reported with any added qualifiers. Qualifications were required for the reasons noted in sections C, F and H.

A. Reporting Limits

The laboratory reporting limits for TPH-gasoline in soil and water matrices met the project required reporting limits, with the following exception:

1. The reporting limits for all soils were raised due to dry weight correction.

B. Holding Times

Technical holding time criteria were met for all project samples.

C. Blanks

Target analytes were not observed in any laboratory method blanks or field QC blanks associated with the project samples, with the following exceptions:

1. Laboratory method blank 3110422-BLK1 had a detected level of TPH-gasoline at 31 ug/kg. The results for TPH-gasoline in the associated samples were changed to non-detect (U) if those results were less than five times the blank amount.
2. Laboratory method blank 3110462-BLK1 had a detected level of TPH-gasoline at 26 ug/kg. The results for TPH-gasoline in the associated samples were changed to non-detect (U) if those results were less than five times the blank amount.
3. Laboratory method blank 3110492-BLK1 had a detected level of TPH-gasoline at 23 ug/kg. The results for TPH-gasoline in the associated samples were changed to non-detect (U) if those results were less than five times the blank amount.
4. Laboratory method blank 3110549-BLK1 had a detected level of TPH-gasoline at 38 ug/kg. The results for TPH-gasoline in the associated samples were changed to non-detect (U) if those results were less than five times the blank amount.

5. Laboratory method blank 3110585-BLK1 had a detected level of TPH-gasoline at 27 ug/kg. The results for TPH-gasoline in the associated samples were changed to non-detect (U) if those results were less than five times the blank amount.
6. Laboratory method blank 3110638-BLK1 had a detected level of TPH-gasoline at 44 ug/kg. The results for TPH-gasoline in the associated samples were changed to non-detect (U) if those results were less than five times the blank amount.
7. Laboratory method blank 3120058-BLK1 had a detected level of TPH-gasoline at 30 ug/kg. The results for TPH-gasoline in the associated samples were changed to non-detect (U) if those results were less than five times the blank amount.
8. Laboratory method blank 3120098-BLK1 had a detected level of TPH-gasoline at 29 ug/kg. The results for TPH-gasoline in the associated samples were changed to non-detect (U) if those results were less than five times the blank amount.
9. Laboratory method blank 3120253-BLK1 had a detected level of TPH-gasoline at 31 ug/kg. The results for TPH-gasoline in the associated samples were changed to non-detect (U) if those results were less than five times the blank amount.
10. Laboratory method blank 3120276-BLK1 had a detected level of TPH-gasoline at 2370 ug/kg. The results for TPH-gasoline in the associated samples were greater than 5 times the blank amount, and qualification was not required.
11. Laboratory method blank 3120778-BLK1 had a detected level of TPH-gasoline at 14 ug/L. The results for TPH-gasoline in the associated samples were changed to non-detect (U) if those results were less than five times the blank amount.
12. Laboratory method blank 3120491-BLK1 had a detected level of TPH-gasoline at 26 ug/kg. The results for TPH-gasoline in the associated samples were greater than 5 times the blank amount, and qualification was not required.
13. Laboratory method blank 3120531-BLK1 had a detected level of TPH-gasoline at 24 ug/kg. The results for TPH-gasoline in the associated samples were changed to non-detect (U) if those results were less than five times the blank amount.
14. Laboratory method blank 4010448-BLK1 had a detected level of TPH-gasoline at 28 ug/kg. The results for TPH-gasoline in the associated samples were changed to non-detect (U) if those results were less than five times the blank amount.
15. Laboratory method blank 4020099-BLK1 had a detected level of TPH-gasoline at 32 ug/kg. The results for TPH-gasoline in the associated samples were changed to non-detect (U) if those results were less than five times the blank amount.

16. Laboratory method blank 4010468-BLK1 had a detected level of TPH-gasoline at 34 ug/kg. The result for TPH-gasoline in the associated sample was changed to non-detect (U) since that result was less than five times the blank amount.
17. Equipment blank 237RB248 had a detected level of TPH-gasoline at 16 ug/L. The value was converted to solid matrix units and the project samples were evaluated for blank contamination. The levels of TPH-gasoline in the associated samples were greater than five times the blank amount, and qualification was not required. It should be noted that the detected result for TPH-gasoline in this equipment blank was changed to non-detect due to contamination in the method blank.
18. Trip blank TB(121703) had a detected level of TPH-gasoline at 11 ug/L. The value was converted to solid matrix units and the project samples were evaluated for blank contamination. The levels of TPH-gasoline in the associated samples were greater than five times the blank amount, and qualification was not required. It should be noted that the detected result for TPH-gasoline in this trip blank was changed to non-detect due to contamination in the method blank.

See Table H2 of this report for a summary of qualifications due to blank contamination.

D. Initial Calibration

Initial calibration criteria were met for all calibration standards associated with the project samples.

E. Continuing Calibration

Continuing calibration criteria were met for all continuing calibration standards associated with the project samples.

F. Matrix Spike/Matrix Spike Duplicate

All QC criteria were met for the matrix spikes and matrix spike duplicates associated with the project samples, with the following exceptions:

1. The percent recovery for TPH-gasoline failed the 65%-135% acceptance criteria in QC sample 1065EX217(9.5) (P311408-01) MSD at 63%. The detected result for TPH-gasoline in the parent sample was qualified as estimated with a low bias (J-). (QC batch 3110462)
2. The percent recovery for TPH-gasoline failed the 65%-135% acceptance criteria in QC sample 1065EX205(5.5) (P312003-01) MSD2 at 58%. The detected result for TPH-gasoline in the parent sample was qualified as estimated with a low bias (J-). (QC batch 3120058)
3. The percent recoveries for TPH-gasoline failed the 65%-135% acceptance criteria in QC samples P312454-04 MS/MSD. The parent sample was associated with a site unrelated to the project site, and qualification of the project samples was not required. (QC batch 3120491).

4. The percent recoveries for TPH-gasoline failed the 65%-135% acceptance criteria in QC samples 1065EX240(3.0) (P312512-03) MS2/MSD2 at 61% and 60%, respectively. The detected result for TPH-gasoline in the parent sample was qualified as estimated with a low bias (J-). (QC batch 3120531)

See Table H2 of this report for a summary of qualifications due to matrix spike percent recovery failure.

G. Laboratory Control Samples

All QC criteria were met for the laboratory control samples associated with the project samples.

H. Surrogate Recoveries

Surrogate spike recoveries met QC acceptance criteria for all project samples, with the following exceptions:

1. The percent recovery for surrogate 4-bromofluorobenzene was outside the 65%-135% project acceptance criteria in sample 1065EX234(9.5) (P312003-08) at 5%. Recoveries less than 30% require rejection of non-detected results. The non-detected results for TPH-gasoline and unknown hydrocarbons in this sample were qualified as rejected (R) due to extremely low surrogate recovery.
2. The percent recovery for surrogate 4-bromofluorobenzene was outside the 65%-135% project acceptance criteria in sample DUP(120803) (P312205-07) at 150%. The sample required a 2500-fold dilution due to the presence of high levels of gasoline, and qualification for surrogate recovery failure was not required.
3. The percent recovery for surrogate 4-bromofluorobenzene was outside the 65%-135% project acceptance criteria in sample DUP(040123) (P401369-02) at 16%. Percent recoveries less than 30% require rejection of non-detected results. The non-detected result for TPH-gasoline and unknown hydrocarbons in this sample was qualified as rejected (R) due to extremely low surrogate recovery. It should be noted that the result for TPH-gasoline in this sample was previously changed to non-detect due to method blank contamination.

See Table H2 of this report for a summary of qualifications due to surrogate percent recovery failure.

I. Compound Identification and Quantitation

For the samples that received full data validation, no problems were observed with compound identification and quantitation. Samples 1065EX214(9.5) (P311384-01), 1065EX219(7.5) (P311384-02), 1065EX215(8.5) (P311384-03), 1065EX216(7.5) (P311384-04) and 1065EX218(10.0) (P311384-05) received full (Level IV) data validation. This included re-calculation of initial and continuing calibrations, and surrogate values; in addition to re-calculation of the reported results for TPH-gasoline in these samples. In the samples that received full data

validation, all recalculated results were verified to match those reported by the laboratory.

III. Total Petroleum Hydrocarbons – TPH-Diesel/TPH-Fuel Oil Range (8015B)

Overall, the data are usable as reported with any added qualifiers. Qualifications were required for the reasons noted in sections C and F.

A. Reporting Limits

The laboratory reporting limits for TPH-diesel and TPH-fuel oil in water and soil matrices met the project required reporting limits, with the following exception:

1. The reporting limits for all soils were raised due to dry weight correction.

B. Holding Times

Technical holding time criteria were met for all project samples.

C. Blanks

Target analytes were not observed in any laboratory method blanks or field QC blanks associated with the project samples, with the following exceptions:

1. Laboratory method blank 3110431-BLK1 had detected levels of TPH-diesel (1.1 mg/kg) and TPH-fuel oil (1.6 mg/kg). The results for TPH-diesel in the associated samples were greater than 5 times the blank amount, and qualification was not required. The results for TPH-fuel oil in the associated samples were changed to non-detect (U) if those results were less than five times the blank amount.
2. Laboratory method blank 3110460-BLK1 had detected levels of TPH-diesel and unknown fuel hydrocarbons at 1.2 mg/kg. The results for TPH-diesel and unknown fuel hydrocarbons in the associated samples were changed to non-detect (U) if those results were less than five times the blank amount.
3. Laboratory method blank 3110592-BLK1 had detected levels of TPH-diesel and unknown fuel hydrocarbons at 1.2 mg/kg. The results for TPH-diesel and unknown fuel hydrocarbons in the associated samples were changed to non-detect (U) if those results were less than five times the blank amount.
4. Laboratory method blank 3110605-BLK1 had a detected level of TPH-diesel at 0.028 mg/L. The associated samples were non-detect for TPH-diesel, and qualification was not required.
5. Laboratory method blank 3110621-BLK1 had detected levels of TPH-diesel and unknown fuel hydrocarbons (2.4 mg/kg) and TPH-fuel oil (1.2 mg/kg). The results for TPH-diesel, unknown fuel hydrocarbons and TPH-fuel oil in the associated samples were changed to non-detect (U) if those results were less than five times the blank amount.

6. Laboratory method blank 3120049-BLK1 had detected levels of TPH-diesel and unknown fuel hydrocarbons at 1.1 mg/kg. The results for TPH-diesel and unknown fuel hydrocarbons in the associated samples were changed to non-detect (U) if those results were less than five times the blank amount.
7. Laboratory method blank 3120263-BLK1 had detected levels of TPH-diesel and unknown fuel hydrocarbons (1.1 mg/kg) and TPH-fuel oil (1.1 mg/kg). The results for TPH-diesel, unknown fuel hydrocarbons and TPH-fuel oil in the associated samples were changed to non-detect (U) if those results were less than five times the blank amount.
8. Laboratory method blank 3120526-BLK1 had detected levels of unknown fuel hydrocarbons (3.6 mg/kg) and TPH-fuel oil (1.7 mg/kg). The results for unknown fuel hydrocarbons and TPH-fuel oil in the associated samples were changed to non-detect (U) if those results were less than five times the blank amount.
9. Laboratory method blank 4010459-BLK1 had detected levels of unknown fuel hydrocarbons (2.9 mg/kg) and TPH-fuel oil (1.9 mg/kg). The results for unknown fuel hydrocarbons and TPH-fuel oil in the associated samples were changed to non-detect (U) if those results were less than five times the blank amount.
10. Laboratory method blank 4020037-BLK1 had detected levels of TPH-diesel and unknown fuel hydrocarbons (2.0 mg/kg) and TPH-fuel oil (1.4 mg/kg). The results for TPH-diesel, unknown fuel hydrocarbons and TPH-fuel oil in the associated samples were changed to non-detect (U) if those results were less than five times the blank amount.
11. Laboratory method blank 4010484-BLK1 had detected levels of diesel (1.3 mg/kg), unknown fuel hydrocarbons (1.3 mg/kg) and TPH-fuel oil (0.92 mg/kg). The results for diesel, unknown fuel hydrocarbons and TPH-fuel oil in the associated sample were changed to non-detect (U) since those results were less than five times the blank amount.
12. Equipment blank 237RB248 had a detected level of unknown fuel hydrocarbons at 0.023 mg/L. The value was converted to solid matrix units and the project samples were evaluated for blank contamination. The levels of unknown fuel hydrocarbons in the associated samples were greater than five times the blank amount, and qualification was not required.

See Table H2 of this report for a summary of qualifications due to blank contamination.

D. Initial Calibration

Initial calibration criteria were met for all calibration standards associated with the project samples.

E. Continuing Calibration

Continuing calibration criteria were met for all continuing calibration standards associated with the project samples.

F. Matrix Spike/Matrix Spike Duplicate

All QC criteria were met for the matrix spikes and matrix spike duplicates associated with the project samples, with the following exceptions:

1. The percent recoveries for TPH-diesel failed the 65%-135% acceptance criteria in QC samples 1065EX238(6.5) (P311408-05) MS/MSD. The amount of TPH-diesel present in the parent sample was greater than four times the amount spiked, and qualification was not required. (QC batch 3110460)
2. The percent recoveries for TPH-diesel failed the 65%-135% acceptance criteria in the original extraction of QC samples 1065EX226(11.0) (P311511-01) MS/MSD at 57% and 64%, respectively. The MS/MSD were re-extracted and re-analyzed, with improved and passing results at 75% and 75%, respectively. Since the percent recoveries for TPH-diesel met acceptance criteria in the re-extraction, qualification of the parent sample was not required. (QC batch 3110592)
3. The percent recoveries for TPH-diesel failed the 65%-135% acceptance criteria in QC samples DUP(120803) (P312205-07) MS/MSD at 478% and 324%, respectively. The detected result for TPH-diesel in the parent sample was qualified as estimated with a high bias (J+). (QC batch 3120263)

See Table H2 of this report for a summary of qualifications due to matrix spike percent recovery failures.

G. Laboratory Control Samples

All QC criteria were met for the laboratory control samples associated with all project samples.

H. Surrogate Recoveries

Surrogate spike recoveries met QC acceptance criteria for all project samples, with the following exceptions:

1. Surrogate recoveries that failed in samples that required dilutions of 5X or greater did not require qualification and are not noted in this report.

I. Compound Identification and Quantitation

For the samples that received full data validation, no problems were observed with compound identification and quantitation. Samples 1065EX214(9.5) (P311384-01), 1065EX219(7.5) (P311384-02), 1065EX215(8.5) (P311384-03), 1065EX216(7.5) (P311384-04) and 1065EX218(10.0) (P311384-05) received full (Level IV) data validation. This included re-calculation of initial and continuing calibrations, and surrogate values; in addition to re-calculation of the reported results for TPH-diesel/fuel oil in these samples. In the samples that received full data

validation, all recalculated results were verified to match those reported by the laboratory.

IV. Metals (6010B/6020/7470A/7471A)

Overall, the data are usable as reported with any added qualifiers. Qualifications were required for the reasons noted in sections C and E.

A. Reporting Limits

The laboratory reporting limits met the project required reporting limits, with the following exception:

1. The reporting limits for all soils were raised due to dry weight correction.

B. Holding Times

Technical holding time criteria were met for all project samples.

C. Blanks

Target analytes were not observed in any blanks associated with the project samples, with the following exceptions:

1. Laboratory method blank 3110429-BLK1 had a detected level of beryllium at 0.062 mg/kg. The associated samples had beryllium values greater than five times the blank amount, and qualification was not required.
2. Laboratory method blank 3110415-BLK1 had a detected level of mercury at 0.0056 mg/kg. The results for mercury in the associated samples were changed to non-detect (U) if those results were less than five times the blank amount.
3. Laboratory method blank 3110447-BLK1 had detected levels of barium (0.068 mg/kg), chromium (0.18 mg/kg) and lead (0.021 mg/kg). The associated samples had barium, chromium and lead values greater than five times the blank amount, and qualification was not required.
4. Laboratory method blank 3110554-BLK1 had detected levels of arsenic (35 ug/L), beryllium (0.19 ug/L) and nickel (14 ug/L). All associated project samples were non-detect for arsenic and beryllium, and qualification was not required. The results for nickel in the associated samples were changed to non-detect (U) if those results were less than five times the blank amount.
5. Laboratory method blank 3110588-BLK1 had a detected level of thallium at 0.052 mg/kg. The results for thallium in the associated samples were changed to non-detect (U) if those results were less than five times the blank amount.
6. Laboratory method blank 3120010-BLK1 had detected levels of lead (0.019 mg/kg), nickel (1.1 mg/kg) and thallium (0.024 mg/kg). The associated samples had lead and nickel values greater than five times the blank amount, and qualification was not required. The results for thallium in the associated samples were changed to non-detect (U) if those results were less than five times the blank amount.

7. Laboratory method blank 3120003-BLK1 had a detected level of mercury at 0.0012 mg/kg. The associated samples had mercury values greater than five times the blank amount, and qualification was not required.
8. Laboratory method blank 3120050-BLK1had a detected level of thallium at 0.052 mg/kg. The results for thallium in the associated samples were changed to non-detect (U) if those results were less than five times the blank amount.
9. Laboratory method blank 3120046-BLK1 had a detected level of mercury at 0.0019 mg/kg. The associated samples had mercury values greater than five times the blank amount, and qualification was not required.
10. Laboratory method blank 3120271-BLK1 had detected levels of barium (0.075 mg/kg), chromium (0.22 mg/kg), molybdenum (0.054 mg/kg) and thallium (0.070 mg/kg). The associated samples had barium and chromium values greater than five times the blank amounts, and qualification was not required. The results for molybdenum and thallium in the associated samples were changed to non-detect (U) if those results were less than five times the blank amounts.
11. Laboratory method blank 3120554-BLK1 had a detected level of lead at 3.0 mg/kg. The results for lead in the associated samples were changed to non-detect (U) if those results were less than five times the blank amount.
12. Laboratory method blank 3120781-BLK1 had detected levels of copper (8.5 ug/L) and zinc (8.0 ug/L). All associated project samples were non-detect for copper and zinc, and qualification was not required.
13. Laboratory method blank 4010446-BLK1 had a detected level of thallium at 0.032 mg/kg. The results for thallium in the associated samples were changed to non-detect (U) if those results were less than five times the blank amount.
14. Laboratory method blank 4010461-BLK1 had a detected level of mercury at 0.0019 mg/kg. The associated samples had mercury values greater than five times the blank amount, and qualification was not required.
15. Laboratory method blank 4020091-BLK1 had a detected level of thallium at 0.04 mg/kg. The results for thallium in the associated samples were changed to non-detect (U) if those results were less than five times the blank amount.
16. Equipment blank 222RB223 had detected levels of nickel (14 ug/L), antimony (0.41 ug/L) and thallium (0.49 ug/L). The values were converted to solid matrix units and the project samples were evaluated for blank contamination. The levels of nickel in the associated samples were greater than five times the blank amount, and qualification was not required. All associated project samples were non-detect for antimony, and qualification was not required. The results for thallium in the associated samples were changed to non-detect (U) if those results were less than five times the blank amount.

See Table H2 of this report for a summary of qualifications due to blank contamination.

D. Initial and Continuing Calibrations

All initial and continuing calibration standards associated with the project samples met QC acceptance criteria.

E. Matrix Spike/Matrix Spike Duplicate

All QC criteria were met for the matrix spikes and matrix spike duplicates associated with the project samples, with the following exceptions:

1. The percent recoveries for barium, cobalt, nickel, antimony, vanadium and zinc failed the 75%-125% acceptance criteria in QC samples 1065EX214(9.5) (P311384-01) MS/MSD. The results for barium, antimony and zinc in the associated samples were qualified as estimated with a low bias (J-/UJ). The detected results for cobalt, nickel and vanadium in the associated samples were qualified as estimated with a high bias (J+). (QC batch 3110429)
2. The percent recoveries for antimony, vanadium and zinc failed the 75%-125% acceptance criteria in QC samples 1065EX217(9.5) (P311408-01) MS/MSD. The results for antimony and zinc in the associated samples were qualified as estimated with a low bias (J-/UJ). The detected results for vanadium in the associated samples were qualified as estimated with a high bias (J+). (QC batch 3110447)
3. The percent recoveries for arsenic and antimony failed the 75%-125% acceptance criteria in QC samples 1065EX200(5.0) (P311440-01) MS/MSD. The results for arsenic and antimony in the associated samples were qualified as estimated with a low bias (J-/UJ). (QC batch 3110491)
4. The percent recoveries for barium and antimony failed the 75%-125% acceptance criteria in QC samples 1065EX223(9.5) (P311474-01) MS/MSD. The results for antimony in the associated samples were qualified as estimated with a low bias (J-/UJ). The detected results for barium in the associated samples were qualified as estimated with a high bias (J+). (QC batch 3110544)
5. The percent recovery for selenium failed the 75%-125% acceptance criteria in QC sample 222RB223 (P311474-03) MSD. The result for selenium in the associated sample was qualified as estimated with a low bias (J-/UJ). (QC batch 3110554)
6. According to the laboratory case narrative, mercury was not recovered in QC samples 222RB223 (P311474-03) MSD1 and MSD2 due to an error made by the analyst at the time of digestion. Data was not qualified for the QC failure of these samples, since the recoveries for samples MS1 and MS2 were 102% and 104%, respectively. (QC batch 3110535)
7. The percent recoveries for antimony and chromium failed the 75%-125% acceptance criteria in QC samples 1065EX226(11.0) (P311511-01) MS/MSD. The results for antimony and chromium in the associated samples were qualified as estimated with a low bias (J-/UJ). (QC batch 3110588)

8. The percent recoveries for antimony failed the 75%-125% acceptance criteria in QC samples 1065EX228(13.0) (P311553-01) MS/MSD. The results for antimony in the associated samples were non-detect and qualified as estimated (UJ). (QC batch 3120010)
9. The percent recoveries for antimony failed the 75%-125% acceptance criteria in QC samples DUP031201 (P312003-10) MS/MSD. The results for antimony in the associated samples were qualified as estimated with a low bias (J-/UJ). (QC batch 3120050)
10. The percent recoveries for antimony and beryllium failed the 75%-125% acceptance criteria in QC samples 1065EX212(8.0) (P312205-01) MS/MSD. The results for antimony and beryllium in the associated samples were qualified as estimated with a low bias (J-/UJ). (QC batch 3120271)
11. The percent recovery for mercury failed the 75%-125% acceptance criteria in QC sample 1065EX212(8.0) (P312205-01) MSD at 0%. The detected results for mercury in the associated samples were qualified as estimated with a low bias (J-). (QC batch 3120262)
12. The percent recoveries for antimony, barium, chromium, nickel and zinc failed the 75%-125% acceptance criteria in QC samples 1065EX248(9.0) (P312509-02) MS/MSD. The results for antimony, barium, chromium, nickel and zinc in the associated sample were qualified as estimated with a low bias (J-/UJ). (QC batch 3120554)
13. The percent recovery for mercury failed the 75%-125% acceptance criteria in QC sample 1065EX248(9.0) (P312509-02) MSD. The detected results for mercury in the associated samples were qualified as estimated with a high bias (J+). (QC batch 3120588)
14. The percent recoveries for antimony, chromium and vanadium failed the 75%-125% acceptance criteria in QC samples 1065EX245(9.0) (P401369-01) MS/MSD. The detected results for chromium and vanadium in the associated samples were qualified as estimated with a high bias (J+). The detected results for antimony in the associated samples were qualified as estimated with a low bias (J-). (QC batch 4010446)
15. The percent recoveries for barium, copper, nickel, silver, vanadium and zinc failed the 75%-125% acceptance criteria in QC samples 1065SP201 (P401383-01) MS/MSD. In addition, the relative percent difference (RPD) between the results for silver in the MS and MSD failed the 30% RPD acceptance criteria. The amount of vanadium present in the parent sample was greater than four times the amount spiked, and qualification was not required. The result for silver in the associated sample was qualified as estimated with a low bias for matrix spike percent recovery and RPD failure. The results for barium, copper, nickel and zinc in the associated sample were qualified as estimated with a low bias (J-/UJ) for matrix spike recovery failure. (QC batch 4010489)

16. The percent recoveries for mercury failed the 75%-125% acceptance criteria in QC samples 1065SP201 (P401383-01) MS/MSD. The amount of mercury present in the parent sample was greater than four times the amount spiked, and qualification was not required. (QC batch 4010480)
17. The percent recoveries for antimony, barium, chromium, nickel and silver failed the 75%-125% acceptance criteria in QC samples 1065EX244(6.5) (P401484-01) MS/MSD. The detected results for barium, chromium and nickel in the associated samples were qualified as estimated with a high bias (J+). The non-detected results for antimony and silver in the associated samples were qualified as estimated (UJ). (QC batch 4020091)

See Table H2 of this report for a summary of qualifications due to matrix spike percent recovery failures.

F. Laboratory Control Samples

All QC criteria were met for the laboratory control samples associated with the project samples.

G. Laboratory Duplicate Samples

All QC criteria were met for the laboratory duplicate samples associated with the project samples, with the following exception:

1. Sample results less than the laboratory reporting limits did not require qualification for failed relative percent differences between the duplicate results, and are not noted in this report.

H. ICP Interference Check Standards

All QC criteria were met for the ICP interference check standards associated with the project samples.

I. ICP Serial Dilution

All QC criteria were met for the ICP serial dilutions associated with the project samples.

J. Compound Identification and Quantitation

For the samples that received full data validation, no problems were observed with compound identification and quantitation. Samples 1065EX214(9.5) (P311384-01), 1065EX219(7.5) (P311384-02), 1065EX215(8.5) (P311384-03), 1065EX216(7.5) (P311384-04) and 1065EX218(10.0) (P311384-05) received full (Level IV) data validation. This included re-calculation of the reported results for all metals in these samples. In the samples that received full data validation, all recalculated results were verified to match those reported by the laboratory.

V. Total Organic Carbon (Walkley Black)

Overall, the data are usable as reported. Qualification was not required.

A. Reporting Limits

Project required reporting limits for total organic carbon in soil matrix samples were not provide in the project QAPP. The reporting limits for all soils were raised due to dry weight correction.

B. Holding Times

Technical holding time criteria were met for all project samples.

C. Blanks

Target analytes were not observed in any laboratory method blanks associated with the project samples.

D. Matrix Spike/Matrix Spike Duplicate

All QC criteria were met for the matrix spikes and matrix spike duplicates associated with the project samples, with the following exceptions:

1. The percent recoveries for total organic carbon failed the 75%-125% acceptance criteria in QC samples P311430-15 MS/MSD. The parent sample was associated with a site unrelated to the project site, and qualification was not required. (QC batch 3120371)

E. Laboratory Control Samples

All QC criteria were met for the laboratory control samples associated with the project samples.

F. Compound Identification and Quantitation

For the samples that received full data validation, no problems were observed with compound identification and quantitation. Samples 1065EX214(9.5) (P311384-01), 1065EX216(7.5) (P311384-04) and 1065EX218(10.0) (P311384-05) received full (Level IV) data validation. This included re-calculation of the reported results for total organic carbon in these samples. All recalculated results were verified to match those reported by the laboratory. In the samples that received full data validation, all recalculated results were verified to match those reported by the laboratory.

The following paragraphs highlight the essential findings of the field duplicate samples:

Field duplicate precision was evaluated by calculating the relative percent difference (RPD) between detected results in the original sample and its associated duplicate. The control limit used for field duplicates was a relative percent difference less than or equal to 50 percent, or the absolute difference of the two results must be less than the twice the reporting limit for those analytes that were at or near the detection limit. Six samples were collected in duplicate for the Building 1065 sampling event.

Project Sample Primary ID	Lab Sample ID	Project Sample Duplicate ID	Lab Sample ID
1065EX220(9.0)	P311408-02	DUP(031117)	P311408-03
1065EX229(6.0)	P311440-03	DUP031120	P311440-04
1065EX231(9.0)	P312003-05	DUP031201	P312003-10
1065EX208(8.0)	P312205-03	DUP(120803)	P312205-07
1065EX241(5.0)	P312512-01	DUP(121803)	P312512-02
1065EX245(9.0)	P401369-01	DUP(040123)	P401369-02

The attached Table H3 summarizes the field duplicate sample results. The detected results of the original sample and the associated duplicate sample were compared and the calculated RPDs reported. All RPDs met the 50 percent (or +/- 2X RL) precision control limit requirement, with the following exceptions:

1. In field duplicates 1065EX208(8.0) (P312205-03) and DUP(120803) (P312205-07), the RPD between the detected results failed the 50% acceptance criteria for TPH-gasoline at 200% and TPH-diesel at 145%.
2. In field duplicates 1065EX220(9.0) (P311408-02) and DUP(031117) (P311408-03), the RPD between the detected results failed the 50% acceptance criteria for cobalt at 71%.
3. In field duplicates 1065EX229(6.0) (P311440-03) and DUP031120 (P311440-04), the RPD between the detected results failed the 50% acceptance criteria for cobalt at 58% and mercury at 141%.
4. In field duplicates 1065EX241(5.0) (P312512-01) and DUP(121803) (P312512-02), the RPD between the detected results failed the 50% acceptance criteria for mercury at 81%.
5. In field duplicates 1065EX245(9.0) (P401369-01) and DUP(040123) (P401369-02), the RPD between the detected results failed the 50% acceptance criteria for mercury at 51%.

The analysis of field duplicate samples is a measure of both field and analytical precision. The imprecision in the results in the field duplicate pair listed above may be due to the sample matrix, sample non-homogeneity, sampling or laboratory technique, or method defects. Since the effect on the quality of the data is not known, data is not qualified for field duplicate failure.

SUMMARY

The attached Table H1 lists the project samples and the respective analyses that were included in the data validation effort. This table also designates which samples/analyses received Level IV data validation. The attached Table H2 summarizes the data qualifications required for the project samples for each test method included in the data packages. The attached Table H3 summarizes the field duplicate sample results.

USABILITY

The quality control criteria were reviewed, and other than those discussed above, all criteria were met and the data are considered acceptable. Rejected sample results (R) are not usable for any purpose. Estimated sample results (J/UJ) are usable only for limited purposes. Based upon the cursory and full data validation, all other results are considered valid and usable for all purposes.

VALIDATION QUALIFIERS IDENTIFICATION

The definitions of the following qualifiers are prepared according to the document, "USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review," October, 1999.

U The analyte was analyzed for, but was not detected above the reported sample quantitation limit. *For this project, several detected results were changed to non-detect and assigned a 'U' qualifier for blank contamination.*

J The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample. *A minus sign (-) indicates the numerical value has a low bias. A plus sign (+) indicates the numerical value has a high bias.*

N The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."

NJ The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.

UJ The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

R The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

U: The sample result was changed to non-detect (U) due to blank contamination.
UJ: The quantitation limit is considered an estimated value for this non-detected analyte.
J-: The sample result is considered an estimated value with a low bias.
J+: The sample result is considered an estimated value with a high bias.
R: The sample result is rejected and is not usable, due to a serious QC failure.

ND: Non-detected
NC: Not calculated. The absolute difference between the sample result and the duplicate sample result is less than twice the reporting limit.
N/A: Not analyzed
NA: Not applicable. Calculation of the relative percent difference between the sample result and the duplicate sample result is not applicable.

Checked by: MJH
Approved by: MAF
